EIGHTH ANNUAL REPORT .

OF THE

Ohio. COMMISSIONER OF STATISTICS, .  
"

TO THE

GOVERNOR OF THE STATE OF OHIO,

FOR THE YEAR 1864.

COLUMBUS :

RICHARD NEVINS, STATE PRINTER.

1865.

# EIGHTH ANNUAL REPORT

## OF THE

### COMMISSIONER OF STATISTICS.

---

#### ARTICLE I.—METEOROLOGY AND CLIMATOLOGY.

Meteorology is valuable only when its records are preserved for a long series of years. Then they can be compared, and we get an *average* of the temperature, fall of water, winds, &c., &c., which enables the inhabitants of any particular region of country to know what increase of heat and cold, wetness and dryness, they may reasonably expect in any given season. There are two general facts, however, which greatly modify the advantage which might be hoped for from these averages. *First*, although we know the average of the variable elements for half a century, and know that the next half century will, in the general average, present almost precisely the same results, yet any one year may exhibit wide variations. For example, the year 1816 was a year of remarkable cold, so much so that it has been memorable ever since on that account. It is quite plain that no general averages will enable us to anticipate such a season. But, on the other hand, we do know, that as the general average varies but little from 50° temperature, that the average of the year will not rise to 55°, nor fall to 45°. In other words, we *know*, by established scientific facts, that no such great changes will take place as will destroy or materially impede vegetation. Such being the case, we may rely on the scientific as well as the Scriptural (Genesis, 5th chap., 22d v.) assertion, that “while the earth remaineth, seedtime and harvest, and cold and heat, and summer and winter, and day and night, shall not cease.”

*Secondly*, it is equally true, that while we know that the general average of the year must be near, say 52°, it may happen that any particular day, or week, may be extraordinarily cold or hot. In the year that is past (1864), we have a remarkable example of that fact in the very extraordinary cold of the first part of January, 1864. Most persons will remember that season. The record of these cold days, as recorded by myself at Morrow (Warren county), was as follows. The observations were taken near 7 o'clock in the morning, and indicated the coldest point reached in the day-time :

January 1st .....	10 deg. <i>below zero.</i>
“ 2d .....	4 “ “ “
“ 3d .....	12 “ <i>above</i> “
“ 4th .....	16 “ “ “
“ 5th .....	16 “ “ “
“ 6th .....	6 “ <i>below</i> “
“ 7th .....	4 “ <i>above</i> “
“ 8th .....	2 “ “ “
“ 9th .....	4 “ <i>below</i> “
“ 10th .....	4 “ <i>above</i> “

If we take ten days together, the average is *three degrees above zero*. Probably no other ten days in half a century, in this latitude, can be found with an average temperature so low. But the *effect* on vegetation is not determined by the *average* temperature, but *by the lowest point in a given period*. Thus, the sudden fall of the atmosphere on January 1st, 1864, to 10 deg. below zero, Fahrenheit, was most disastrous to vegetation, in a wide region of country. Another *variable* feature enters into the effect of a given amount of cold entirely distinct from the degree of it. This is the measure of *change*; that is, the *contrast* between the previous condition of the atmosphere and that to which this change brings it. On the 1st of January, 1864, or rather the evening previous, this change and contrast was greater than I have ever known it. In the afternoon of the 31st of December, 1863, it was quite warm, rainy, and the thermometer above 40 deg. At 7 P. M. a sudden rush of wind came from the northwest, keenly cold, increasing at every moment, till, by 10 P. M., every element of the atmosphere seemed to be changed. The wetness and sultriness had totally gone; a dry, cold northwester was blowing, the ground freezing, and all animal life keenly feeling the change. At 7 A. M. next morning the thermometer marked 10 deg. *below zero*; and for the next ten days, as shown in the above table, the weather was intensely cold. Here, it will be observed, the great fact was not that the thermometer marked ten degrees below zero. It had reached that in other years; but the great and injurious feature of this atmospheric phenomenon, was *the greatness and suddenness of the change*. Thus, from 5 P. M. on December 31st, to 7 A. M. of January 1st, the thermometer fell 50 deg. It is really extraordinary that any vegetation, except the old and hardy trees, could withstand such an attack. The actual result was really, for a short time, calamitous. I have shown in other reports how large an item, in our annual crops, was the production and value of fruits. The great peach orchards of Clermont, Warren, and other counties, are not exceeded by any garden increase of such products. They count many hundreds, if not thousands of acres. Of these orchards a large number of the trees are destroyed; and in the immediate region where this storm of cold was most violent, all fruits (except berries) were killed in the bud. In the larger part (nearly the whole) of Ohio there were no peaches, no cherries, or

plums, or quinces, and but few apples, with a scant grape crop. This was a great deprivation, not merely to the appetites, but to the pockets of the producers. The fruit market of Cincinnati presented a great contrast to its appearance in the year before. That was scarce, and enormously high. A phenomenon was seen which I believe was never before exhibited. The largest part of the peaches sold in Cincinnati were brought from Delaware and Maryland, as most of the apples had been in previous years from Western New York. This exhibits a double phenomena; that even in the mild climate of the Ohio valley, we had not been able to raise our own fruit, and that steam locomotion had been brought to such perfection, that we can transport safely to market, over hundreds of miles, even such tender fruit as the peach.

The storm of the 1st of January, 1864, was so remarkable, that I shall repeat here the Thermometrical table (prepared for my last report) which indicates the course of this storm:

From subsequent accounts, it seems that the storm gathered its force on the great plains near the Rocky Mountains, and swept with terrible effect over the States of Minnesota, Iowa, Wisconsin and Illinois, losing its strength as it proceeded east and south. The following table, of the lowest point of depression at several places, will show its direction and force:

Place.	Latitude.	Thermometer.
Fort Snelling.....	44 deg. 53 min. N.	50 deg. <i>below zero</i> .
Minnesota Junction.....	.....	35 " "
Oskosh (Wis.).....	.....	38 " "
Rockford (Ill.).....	.....	33 " "
Madison (Wis.).....	.....	34 " "
St. Paul (Minn.).....	44 deg. 52 min.	30 " "
Dubuque (Iowa).....	.....	30 " "
Milwaukee (Wis.).....	43 deg. 04 min.	32 " "
Galena (Ill.).....	.....	30 " "
Fort Wayne (Ind.).....	41 deg. 05 min.	28 " "
Kankakee (Ill.).....	.....	26 " "
Lafayette (Ind.).....	.....	23 " "
Greencastle (Ind.).....	.....	23 " "
Evansville (Ind.).....	.....	22 " "
St. Louis (Mo.).....	38 deg. 37 min.	19½ " "
Quincy (Ill.).....	.....	15 " "
Morrow (Ohio).....	39 deg. 30 min.	10 " "
Buffalo (N. Y.).....	42 deg. 53 min.	9 " "

The axis of the storm seems to have passed from the great northwestern plains, through Fort Snelling, and then diverging to the southeast, passing through Milwaukee to Fort Wayne, and rapidly diminishing in force as it passed to the east. Indeed, it diminished much more rapidly going east than it did going south. St. Louis is 6 deg. south of Fort Snelling, and the cold was less there by 30 deg.; but, on the other hand, Buffalo is 4 deg. north of St. Louis, but the cold was 10 deg. less than at St. Louis.

The general theory of storms, now received by scientific men, is, that each one is a whirlwind, beginning in some one point, and moving in concentric circles till it is exhausted by expansion. This is certainly true of the small storms, which can be accurately observed, and has been proved true of some large ones, which have ultimately disappeared on the ocean. In this instance, we have not sufficient data to determine either the origin or termination of this remarkable phenomenon.

The Meteorology of 1864 will be seen in the general averages of Tables 1, 2, 3 and 4, accompanying this report. They are, as follows:

### 1. GENERAL AVERAGES OF CLIMATE AT KELLEY'S ISLAND, OHIO.

Latitude.....	41 deg. 35 m. 44 s. N.
Longitude.....	82 deg. 42 m. 32 s. W.
Altitude.....	587 feet.
Weight of atmosphere (general average).....	29.279 inches.
Temperature (general average).....	50.03 deg.
Extreme elevation.....	92 "
Extreme depression.....	11 "
Range of temperature.....	103 "
Fall of water and melted snow.....	37.41 inches.
Depth of snow fallen.....	26½ "
Latest frost in spring.....	March 30th.
Earliest frost of autumn.....	October 21st.
First frost injuring vegetation.....	November 5th.
Average temperature of four preceding years.....	49.63 deg.
Temperature of 1864 above the average.....	.40 "
Rain and melted snow in 1863.....	29.79 inches.
Fall of water and melted snow in 1864 (above 1863).....	7.62 "

### 2. GENERAL AVERAGE OF CLIMATE AT PORTSMOUTH, OHIO.

Latitude.....	38 deg. 45 min.
Longitude.....	82 deg. 50 min.
Altitude.....	537 feet.
Weight of atmosphere.....	29.74 inches.
Temperature, general average.....	54.38 deg.
Fall of water and melted snow.....	32.08 inches.
Depth of snow fallen.....	19.75 "

### 3. GENERAL AVERAGE OF CLIMATE AT CINCINNATI, OHIO.

Latitude.....	39 deg.
Longitude.....	
Altitude.....	
Weight of atmosphere.....	29.19 inches.
Temperature, general average of.....	53.2 deg.
Fall of water and snow.....	31.5 inches.
Depth of snow.....	24.8 "
First frost.....	October 14th.

## 4. GENERAL AVERAGE OF CLIMATE AT CLEVELAND, OHIO.

Latitude.....	41 deg. 30 min.
Longitude.....	81 deg. 42 min.
Altitude.....	643 feet.
Weight of atmosphere.....	29.197 inches.
Temperature, general average of.....	50.58 deg.
Fall of water and snow.....	32.02 inches.
Depth of snow.....	49.0 "

## 5. COMBINED AVERAGE.

Weight of atmosphere.....	29.35 inches.
Temperature, average of.....	52.05 deg.
Fall of water and snow.....	34.25 inches.
Depth of snow fallen.....	30 "

This should, and does represent very nearly the climate in the centre of the State.

## ARTICLE II.—HORTICULTURE.

There is little to be said on the Horticulture of Ohio, in 1864, which has not been said in the previous article. The sudden change and severe storm in the first week of January, 1864, killed all the peaches, and nearly all the pears and cherries. The same cause, in conjunction with the drouth of the early part of summer, destroyed at least half the apple crop. In fact, it has been many years since Ohio had so small a crop of fruit as in 1864. For the first time was presented the phenomenon of peaches raised on the Delaware and Chesapeake brought to market in Cincinnati. This fact, however, indicates a great change in some branches of commerce. It shows a great revolution in the facilities of transportation, a great advance in horticulture, and a great extension in the means of supply to the markets. The result is a multiplication of the resources, comforts and conveniences of society. Ohio, especially the Miami country, has now many large peach orchards, and it was no small loss, as well as deprivation of comfort, to find these orchards destitute of fruit. But the injury did not stop there. A large number of the older trees were killed altogether. On the other hand, the young trees revived from the attacks of frost, and if the season be favorable are no doubt sufficient to furnish an ample supply of fruit.

The culture of the grape still continues to excite great interest. A new grape, "Ives' Seedling," has attracted much attention. The "Delaware" is still a favorite. I extract the following account of the products of these vines from the proceedings of the Cincinnati Horticultural Society. I may remark, however, that the results are far beyond what any ordinary cultivator, under ordinary circumstances, can expect:

Ives' Seedling is a grape of much promise; not addicted to mildew or rot. Colonel Warring, of Indian Hill, in this county, has a small vineyard, only two acres in bearing, which made the past season 650 gallons of wine. The season previous, only one acre being in bearing, yielded 560 gallons. The Colonel makes his account for the past season's business stand as follows :

650 gallons wine, sold at \$4.10.....	\$2,665
Sale of cuttings.....	1,500

---

4,165

Deduct cost of taking care of vineyard.....	100
---	-----

Leaving the net product of vineyard.....	\$4,065
or over \$2,000 per acre.	

Norton's Virginia is another promising grape, that is being considerably grown hereabouts.

The Messrs. Bogen have given us their figures for the product of this grape, as follows:

1863—From 1½ acres, first year in bearing, they made 500 gallons, sold at \$3.....	\$1,500
Sale of cuttings.....	400
Sale of roots from layers.....	800

---

2,700

Deduct for cost of culture.....	100
---------------------------------	-----

Leaves net.....	\$2,600
or \$1,733 per acre.	

1864—Yield of same and cuttings for same \$2,300, or about \$1,500 per acre.

Delaware is another grape of very great promise and profit, now being extensively grown throughout the country. The Messrs. Bogen from one-third of an acre, first bearing year, give us the following figures for the past season :

87 gallons of wine sold at \$6 per gallon.....	\$522
Sold cuttings.....	450
Sold roots from layers.....	2,050

---

\$3,022

Deduct cost of culture.....	22
-----------------------------	----

---

\$3,000

or \$9,000 per acre.

Mr. J. E. Mottier gives us as the result of his Delaware vineyard for the past two years, as follows:

1863—From one and a half acres :	
165 gallons of wine made and sold at \$5 per gallon.....	\$825
Sale of cuttings.....	1,630

---

2,455

Deduct expenses.....	200
----------------------	-----

Leaving net.....	\$2,225
or \$1,504 per acre.	

1864—From the same vineyard, made :

200 gallons of wine, at \$6 per gallon.....	\$1,200
Sold roots from layers.....	1,835
Sales of cuttings, two years.....	2,360
	<hr/>
	5,395
Deduct expenses.....	200
	<hr/>
	\$5,195

or \$3,562 per acre.

Mr. Mottier says he might have obtained a larger yield of wine, but his vineyard being young, he would not allow it to overbear.

### ARTICLE III.—GENERAL CONDITION OF AGRICULTURE.

I have stated in former reports that agriculture in this State, in regard to culture, machinery and improvement of lands, had decidedly advanced, and this fact still remains true. Indeed, if this were not the case, the cultivation of the State could not have been maintained, and the large surplus of grain which the State has heretofore raised, must have been greatly reduced. Such has been the reduction of labor for the purpose of war, and the necessary abstraction of mind as well as labor from agriculture, that we could not have maintained our position as a great agricultural State without the recent application of machinery on a large scale, to putting in and harvesting the crops. This, with more attention to rotation, draining and fertilizing, has enabled us to keep up the general average of crops, except in the last two seasons, in which the laws of nature, as well as the action of war, have diminished our products decidedly below the aggregates, which, under other conditions, we must have raised. In my report for 1863 (page 10), I remark :

“Notwithstanding this improvement in agriculture, it is nevertheless true that this great branch of our industry has increased little, if any, in the last three years ; in fact, the aggregate of crops has diminished. This is not altogether, but in some degree, due to the abstraction of laborers from the farming classes. It is true we have, in ordinary times, a surplus of laborers, who either become emigrants to the new States, or are engaged in arts and manufactures. But this has not been enough to supply entirely the recruits for the army, as is shown by the much greater than ordinary demand for labor on farms. To this may be added the more or less prevalence of drought in the last two years. The crop of 1860 was the largest we have ever raised ; the crop of 1861 less ; that of 1862 still less ; and it is to be feared that the aggregate crop of 1863 will prove less than either.”

This account proved strictly true. The aggregate crops, as will be seen from the subjoined table, was less than that of any year since 1858. This fact, however, should be taken with this addition—that the culture of the

State has in some measure changed, so that the aggregate of grain crops no longer show, as it once did, nearly the whole product of the State. On the contrary, some new crops have been introduced, and others increased, which do not appear in the aggregate of grain crops. For example, half a dozen years ago no sorghum of any consequence was raised; now it is quite a large crop. So, also, the number of sheep and the crop of tobacco have nearly doubled in that time. Vineyards and orchards and gardens have largely increased; so that we find, in fact, that the diminution in the aggregate of grain crops does not indicate (as would at first appear) an equal diminution in the crops of the State. On the contrary, there are several valuable products which have been decidedly increased. The real changes in crops I shall endeavor to estimate at the close of this article.

Of the aggregate crops of 1863 I say, in my last report (page 18), as follows:

"I have shown in a former table (page 11), that the aggregate crops have diminished since 1860. This remains true in 1863. There can be no doubt, I think, that the *aggregate* crop of 1863 was less than in either of the preceding years, with the exception of tobacco, wool, wine and potatoes; these are probably larger. The grain crops were much injured by the unequal season."

This proved exactly correct. The aggregate crop of 1863 was less than in 1862, while tobacco, wool, wine and potatoes were all increased.

Our annual reports of agriculture are obtained by the assessors in the spring of the following year, which makes the statistics of that branch of industry a year behind all others. For that reason I cannot give in this report any statistics of agriculture for 1864, but I have heretofore succeeded in giving a generalization of the crops in the current years by means of intelligent correspondents, which, as will be seen in the above paragraph, have been remarkably correct.

I shall now proceed to discuss the crops of 1863 separately.

1. OF CORN.—The crop of corn was very much reduced by the drought, and presented a smaller aggregate than in several years. The results were:

Acres planted.....	2,027,811
Bushels produced.....	54,614,617

This gives an average of 27 bushels per acre only, while the general average of a series of years is 34 bushels per acre. Here we find a general reduction of 7 bushels per acre in consequence of the drought. In the aggregate it reduces the crop *fourteen millions of bushels* (14,000,000). The *average* crop would have been 68,000,000. The reduction was 20 per cent. Perhaps no fact will prove the superiority of corn (maize) over any other grain in this climate, for the certainty of its production and uniformity of its crops, than this very one. In a season when, under equally disadvantageous circumstances, other grain crops would have been nearly

destroyed or very greatly reduced, the corn crop falls off but 20 per cent., and this is nearly as great a reduction of the average as has ever occurred.

The successive crops of the last four reported years were as follows :

In 1860 .....	91,588,704 bushels.
In 1861 .....	74,858,878    "
In 1862 .....	62,764,887    "
In 1863 .....	54,614,617    "

Here is a constant reduction, but the average of the four years is higher than the general average of ten years, so that the falling off is not as great as it seems to be. I hazard nothing in saying that during the five years from 1863, the corn crop will increase, and give a greater average than any equal period preceding. The laws of nature, in this respect, operate with what may be termed a *uniform irregularity*. After full crops of any grain or fruit, there seems to be a temporary exhaustion, from which there is a gradual but a certain recovery.

2. OF WHEAT.—I have stated in former reports that this crop is, in our climate, very variable, and liable to the attacks of many enemies. In a series of years, however, we find general averages, which may be relied on. The following is the result of 1863 :

Acres sown .....	1,811,278
Bushels produced.....	20,452,410

This gives an average of 11.36 bushels.

This average per acre is just about the general average, and the aggregate crop is not far from the average. I have mentioned, in past reports, the great change which had taken place in the *locality* of wheat production in this State. Formerly the largest proportion of wheat was raised in the belt of counties immediately below the Western Reserve, and extending nearly across the State, and on the waters of the Muskingum. At present the Miami country takes the lead in wheat culture, as will appear from the following table of ten counties in each :

	Acres.	Bushels.
Brown .....	27,437	332,920
Butler .....	39,766	495,953
Champaign .....	33,128	393,145
Clarke .....	29,488	392,872
Darke .....	36,658	505,972
Greene .....	57,596	344,543
Miami .....	36,450	611,695
Montgomery .....	38,291	663,833
Preble .....	34,094	520,509
Warren .....	27,313	321,787

Aggregate ten counties .....	360,221	4,583,229
------------------------------	---------	-----------

The average per acre of these counties is  $12\frac{1}{2}$  bushels.

	Aeres.	Bushels.
Ashland.....	24,965	248,003
Carroll.....	15,045	141,766
Columbiana.....	17,914	243,254
Holmes.....	24,032	286,692
Jefferson.....	17,316	178,904
Richland.....	27,869	277,391
Sandusky.....	22,330	305,962
Seneca.....	38,373	434,620
Stark.....	37,327	635,625
Wayne.....	36,451	462,147
Ten counties.....	261,222	3,214,364

The average per acre of these ten counties is  $12\frac{1}{2}$  bushels.

It seems, from a comparison of these tables, that the average product per acre is the same in both districts; but, that the culture of wheat in the Miami counties is now much greater than in the old wheat belt.

The product of wheat in this State in the last four reported years was as follows:

	Bushels.
In 1860.....	23,640,356
In 1861.....	20,055,424
In 1862.....	29,916,518
In 1863.....	20,452,410
Aggregate of four years.....	94,054,708
Average crop.....	23,266,177

The average is almost exactly the crop of 1860.

The product of wheat in this State for the four last years has been much greater than for the four previous years.

3. OF OATS.—The crop of oats for 1863 was as follows:

Acres sown.....	548,019
Bushels produced.....	11,317,561
Average per acre.....	20.6 bush.

The crop of previous years was as follows:

In 1860.....	25,127,724 bush.
In 1861.....	17,798,794 “
In 1862.....	11,802,470 “
In 1863.....	11,317,561 “

The oats crop, in quantity, seems to have followed the same law with corn. It has steadily decreased during the last four years. The general average of the oats crop in the last eight years is about 15,000,000 bushels. In the years 1862 and 1863 the crop has fallen much below this. The *average per acre* is also nearly one third less.

4. OF BARLEY.—The cultivation of barley in this State has, on the

whole, been increasing for several years. This is probably caused by an increase in the manufacture of ale and beer. The crop of 1863 was:

Acres sown.....	74,348
Bushels produced.....	1,329,251
Average.....	18 bush.

This is a low average for barley, and shows that it has not done as well as wheat. The product of barley in the last four years was:

In 1860.....	1,548,477 bushels.
In 1861.....	1,255,049 “
In 1862.....	1,222,041 “
In 1863.....	1,329,251 “

The average per acre in 1862 was 4 bushels greater than in 1863, but the ground planted in 1863 was 20,000 acres more.

5 OF RYE AND BUCKWHEAT.—These crops are so unimportant in this State as to make a small figure in statistics. I put them together, and the result was:

Acres sown.....	57,103
Bushels produced.....	531,797

This State has never raised, in a long series of years, so small a crop of these articles. As buckwheat may be sown in the early part of August, the amount sown depends almost entirely on the condition of the wheat crop. In one year, when half the wheat crop was destroyed, we raised *three millions* of bushels of buckwheat. In 1863, as will be seen, we raised a very small amount.

6. OF POTATOES.—Potatoes should be classed in the rank of bread-stuffs. In some countries they supply the place of bread; and in our country they make a substitute in many families for wheat bread. The cultivation of potatoes in this State is rather peculiar. The general average has varied but little in twenty years. Not having increased materially, the consequence is they have become relatively scarce. The crop of 1863 was:

Acres planted.....	80,785
Bushels produced.....	5,297,498
Bushels per acre.....	66

This is a low average, but is as productive to the cultivator as either of the crops of grain. The crops of potatoes for several years were:

	Acres.	Bushels.	Average.
In 1860.....	96,254	9,365,386	98
In 1861.....	80,949	6,556,901	80
In 1862.....	75,367	5,169,327	70
In 1863.....	80,785	5,297,498	66

It will be seen that the same general law of decrease, both in quantity and averages, holds true of potatoes, as of other crops.

7. OF MEADOW AND HAY.—No crop is really more valuable than that of hay. In ordinary seasons, no crop will bring more money than that of hay. Looking to its winter support of the immense number of domestic animals, no crop performs a more valuable service. But the hay crop was reduced in 1863, both in quantity and average, much below any previous year. This was no doubt owing to the drouth in the early part of summer. The following are the results :

Acres of meadow.....	1,195,560
Tons of hay.....	1,095,489
Average per acre.....	90 tons.

The crops of hay during six successive years, were as follows :

	Acres.	Tons.	Av. per acre.
In 1858.....	1,357,874	1,806,461	1.33 tons.
In 1859.....	1,340,672	1,366,055	1.02 “
In 1860.....	1,538,562	2,027,160	1.33 “
In 1861.....	1,461,418	1,708,201	1.16 “
In 1862.....	1,570,252	2,067,280	1.32 “
In 1863.....	1,195,560	1,095,489	.90 “

Here we see that the crops of hay have not followed the law of all the preceding crops. It has not continually decreased. On the contrary, the crop of 1862 was larger than that of 1860, and the largest one raised. The last one was the smallest, and so decidedly inferior to all others, that we are struck with surprise. The crop of 1863 is but little over half an average.

8. OF TOBACCO.—The culture of tobacco in this State has, in consequence of high prices, and the disturbance of the border States (where it was chiefly cultivated), greatly increased. Previous to the last year, we had no accurate statistics of the tobacco crop. Now this crop is taken by the assessors in the same manner as other crops are taken. In my last report I said :

“Several years ago, nearly 20,000 hogsheads of tobacco went from Ohio to the port of Baltimore, which was the main market for Ohio tobacco. At that time, nearly all Ohio tobacco was grown in the counties of Monroe, Belmont, Guernsey, Muskingum, and two or three others in that section. Some years since, the culture of tobacco was introduced into the Miami country, chiefly in the county of Montgomery. Since then, especially the last two years, the tobacco crop has been much increased. Last year the price was so high that many persons were tempted to plant a few acres, so that this year's crop of tobacco must be a large one. In my report of last year (1862), I stated the tobacco crop at about 25,000,000 lbs. It is now (the crop of 1863) probably 35,000,000 lbs.”

The crop of 1863 was something short of that stated above, but was much greater than that of previous years. It is thus given by the assessors :

Acres planted.....	47,262
Pounds produced.....	37,022,323
Average pounds per acre.....	800

The crop of tobacco in this State is now a valuable product; but it may be questioned whether any great enlargement of this crop would be ultimately profitable, not on account of the money value, but of the exhaustion of the soil, which is found to invariably attend the tobacco culture.

9. OF CLOVER.—The returns of the assessors now separate the production of clover hay from that of other hay. It is probable that it was never included in the returns of meadow, and we have, therefore, this much in addition to the former crops. The returns of clover and clover seed were :

Acres of clover .....	403,884
Tons of clover produced .....	301,475
Bushels of clover seed produced .....	151,606

10. OF FLAX.—Either the want of machinery, or from the amount of labor required, flax is not manufactured in this State; but there is no doubt that the introduction of this manufacture would be of immense advantage, both to the body of the people, and to the farmers in particular. The results of the crop were :

Acres of flax cultivated .....	95,170
Bushels of seed.....	624,224
Pounds of fibre.....	3,582,170

The counties in which flax is most cultivated are :

	Bushels of seed.
Allen .....	16,808
Butler .....	11,568
Champaign .....	12,978
Clarke .....	16,609
Darke .....	39,610
Greene .....	23,998
Logan .....	14,423
Mercer .....	19,322
Miami .....	36,565
Montgomery .....	37,506
Preble .....	36,262
Shelby .....	12,019
Van Wert .....	17,127
Delaware .....	27,073
Knox .....	12,719
Mahoning .....	25,024
Morrow .....	23,258
Portage .....	16,761
Richland .....	16,009
Stark .....	11,379
Trumbull .....	21,772
Wayne .....	12,397

These counties raise more than two-thirds the flax raised, and most of them are on the western side of the State.

We have only the two last reports by which to compare the products of flax. They were :

	Aeres.	Bushels of seed.	Pounds of fibre.
In 1862.....	52,546	392,076	2,738,238
In 1863.....	95,170	624,224	3,583,170
Average seed per acre in 1862.....			7½ bushels.
“ “ “ 1863.....			6½ “

It seems that the culture of flax has greatly increased (in proportion), but that the *average* fell off in 1863, as it did of nearly every agricultural product.

11. OF BUTTER AND CHEESE.—The northern counties of the State, particularly those in the eastern part of the Reserve, are largely engaged in the products of the dairy. The section which produces large surplusses is small, and confined to five or six counties. The results in 1863 were :

Pounds of butter .....	31,121,275
Pounds of Cheese.....	19,130,750

Butter being universally used, is almost as universally produced on all farms; but comparatively little is used for exportation out of the State. With cheese it is different. Large surplusses are raised for exportation, most of which formerly went to the Southwest. This surplus is raised almost entirely in eight counties, which also raise a considerable surplus of butter. These counties are :

	Cheese.	Butter.
Ashtabula.....	3,092,226	963,725
Cuyahoga .....	959,719	666,630
Geauga .....	4,095,584	534,234
Lorain .....	1,007,467	816,121
Medina.....	627,354	714,925
Portage .....	2,879,837	800,419
Summit .....	1,403,072	647,224
Trumbull.....	3,521,903	1,267,931

More than nine-tenths of all the cheese raised in the State are raised in these counties, and nearly as large a proportion of the surplus butter. About four millions of pounds of the butter raised in these counties is surplus, and exported ; and of the cheese nearly the whole is exported.

The products of butter and cheese for several years have been as follows :

	Butter.	Cheese.
In 1860.....	38,440,498	24,816,420
In 1861.....	35,442,858	20,637,235
In 1862.....	34,065,629	20,752,097
In 1863.....	31,121,275	19,130,750

There has been a decided falling off in the production of the dairy since

1860. In the mean time, however—as will be seen in another paragraph—the number of sheep in the dairy counties has been greatly increased, and this, with some other changes in culture, will account for the difference.

12. OF SORGHUM.—The culture of sorghum was introduced into this State about six years since. It increased rapidly, but in the last two years has been stationary. The results of the year 1863 were :

Acres cultivated.....	31,255
Pounds of sugar.....	27,359
Gallons of syrup.....	2,347,578

The largest amounts of sugar were produced in the counties of Belmont, Brown, Hamilton, Henry, Jackson and Tuscarawas. The largest quantities of syrup were produced as follows :

	Gallons.
Athens .....	75,961
Belmont.....	74,415
Clermont .....	57,718
Clinton.....	55,500
Gallia .....	61,888
Guernsey.....	60,986
Highland.....	81,741
Meigs .....	60,076
Monroe.....	51,476
Morgan .....	72,501
Muskingum.....	82,377
Noble .....	77,278
Warren .....	55,333
Washington .....	90,976

The comparison of the last two years stands thus :

	Acres.	Sugar.	Syrup.
In 1862 .....	30,963	27,716 lbs.	2,700,071 gallons.
In 1863 .....	31,255	27,359 “	2,347,578 “

This shows no great difference in the products or in the averages.

13. OF MAPLE SUGAR.—The returns of Maple Sugar, for the year 1863, were:

Maple Sugar.....	6,753,948 lbs.
Syrup .....	444,606 gallons.

The comparison with last year's product is :

	Sugar.	Syrup.
In 1862 .....	8,254,184 lbs.	538,019 gallons.
In 1863 .....	6,753,948 “	444,606 “

There is a decided falling off in the amount, but it is, probably, owing to the general causes, which have influenced all other productions.

As we cannot review the entire subject of agricultural production without taking into consideration the animal products, I will now notice the statistics of animals.

14. OF HORSES.—The number and value of horses is:

Number.....	690,892
Value .....	\$39,111,011 00
Average per animal.....	55 00

The number of horses in this State, for several years, were:

In 1860.....	700,097
In 1861.....	737,666
In 1862.....	741,715
In 1863.....	690,892

The demand for horses in this State has been so great since the war began, and the export so large, as fully to account for the diminution expressed in these figures.

15. OF CATTLE.—The number in 1863 was:

Number .....	1,436,990
Value .....	\$18,367,055 00
Average .....	13 00

The number of cattle in different years were:

In 1860 .....	1,902,772
In 1861 .....	1,849,155
In 1862 .....	1,824,774
In 1863 .....	1,436,990

The falling off in cattle is caused, partly, by the increased demand occasioned by the war, and partly by the diminution in the crops of grain and grass, thus increasing the expense of keeping them.

16. OF HOGS.—The number of hogs in 1863 were:

Number.....	1,646,506
Value .....	\$4,994,234 00
Average.....	3 00

The number in different years were:

In 1860 .....	2,242,814
In 1861 .....	2,571,404
In 1862 .....	2,765,900
In 1863 .....	1,646,506

From 1860 to 1862 the number of hogs increased 24 per cent., and in the last year decreased 40 per cent. This is so sudden and great a diminution as to cause surprise. The causes for it are probably several. One of the causes of this was the extraordinary cold storm of the first ten days in January, 1864. No doubt many young pigs were killed then, which

would otherwise have appeared on the Assessor's lists in April. Another, and great cause, was the continued high price of corn, which made it unprofitable for the small farmers to fat cattle. Another is the increasing density of population, which in all countries diminishes the profit of keeping hogs. It is not probable Ohio will ever again keep as many hogs as it has done in some years past.

**17. OF SHEEP.**—This class of animals are kept chiefly for their produce in wool. But as the price and profits of wool depend almost wholly on the woolen manufacture, and that again on the tariffs, the number of sheep in Ohio has fluctuated very much. As the war caused a comparatively high tariff, and cotton goods advanced in price, woolen came in demand; the price of wool advanced correspondingly, and sheep have multiplied in Ohio. The number in 1863 were :

Number .....	5,560,318
Value .....	\$17,502,657 00
Average value .....	3 15

The number in a series of years were :

In 1840 .....	2,028,401
In 1850 .....	3,942,929
In 1854 .....	4,845,189
In 1860 .....	3,368,174
In 1861 .....	3,934,763
In 1862 .....	4,448,227
In 1863 .....	5,560,318

From 1840 to 1860, a period of twenty years, sheep had increased 65 per cent., (although in 1854 they had been much more numerous,) and from 1860 to 1863 (three years), they increased 66 per cent. The number nearly trebled from 1840 to 1864.

The largest number of sheep are still found in the eastern and central counties. The following are the counties having the largest number of sheep:

Ashtabula .....	103,503
Belmont .....	141,171
Carroll .....	127,249
Columbiana .....	155,891
Coshocton .....	117,730
Guernsey .....	126,181
Harrison .....	151,885
Holmes .....	126,926
Jefferson .....	135,402
Knox .....	134,898
Trumbull .....	119,703
Wayne .....	102,537
Licking .....	216,487
Lorain .....	138,250
Madison .....	115,119

Mahoning .....	113,488
Medina .....	127,981
Morgan .....	103,920
Muskingum .....	140,085
Portage .....	121,566
Seneca .....	104,498
Stark .....	128,198
Tuscarawas .....	127,517

These counties average 130,000 sheep each, and were this ratio continued in all counties the number of sheep in the State would be doubled.

#### SECTION 2d—REVIEW OF THE AGRICULTURAL CONDITION IN 1864.

1. ARABLE LAND.—The arable land is the ploughed land, that which produces grain or food, and is generally taken as the test of the real culture of a country. The ploughed land of Ohio has been increasing with the increase of population, and must necessarily do so, as arable land is that which either directly or indirectly supports men, that is, makes bread and meat. The arable land embraced in the above summary of productions, is as follows:

Acres in corn .....	2,027,811
“ wheat .....	1,811,278
“ oats .....	548,019
“ barley .....	74,348
“ buckwheat and rye .....	57,103
“ potatoes .....	80,785
“ tobacco .....	47,262
“ sorghum .....	31,255

Total number of acres ploughed in..... 4,677,861

I have excluded from this statement all the crops of grass, flax, etc. Tobacco is the only article in the table not, in some degree, the food of man. Let us now compare this table with the quantity of land planted in the same crops in previous years:

	1860.	1861.	1862.	1863.
Corn .....	2,397,639	2,266,129	2,120,554	2,027,811
Wheat .....	1,844,677	1,931,002	2,401,535	1,811,278
Oats .....	830,104	728,722	574,820	548,019
Barley .....	72,564	60,501	55,478	74,348
Rye and buckwheat .....		120,763	78,288	57,103
Potatoes .....		80,949	75,367	80,785
Sorghum .....			27,716	31,255
Tobacco .....				47,262
Average .....	5,144,984	5,248,066	5,333,758	4,677,861

Adding about 200,000 acres in 1860 for potatoes and buckwheat, and the ratio of arable land in three years will be .53, .52, .53, .46. This shows that there was really no serious falling off in ploughed land till 1863, and then the falling off was equal to *twelve per cent*. There is no doubt that the largest part of this reduction was due solely to the *reduction of labor*. Full one-third of those who plough the land have gone into the army, and this must necessarily cause a *reduction in the preparation and cultivation of farming land*. The reduction in *ploughed land* is equal to 700,000 acres, which is equal to *fourteen millions of bushels of grain*.

## SECTION 2.—IMPROVED LANDS.

*Improved* lands comprehend not merely the *arable*, but also meadows, pasture, fallow and garden land. Besides the above enumerated arable land, there are at least 500,000 acres in orchards, gardens, roads, public grounds, etc., etc. The following were the *improved* lands returned in the last censuses:

	Acres.
In 1850, improved land.....	9,851,493
In 1860, “ “ .....	13,051,945
Increase .....	35 per ct.

Of the last four years, two, as we have seen, increased the cultivation, and two reduced it. On the whole, (including fallow ground, which we may presume is now largely increased), the cultivated land of the State must be very nearly what it was in 1860. Most of the cultivated land is returned by the assessors in the return of crops, and the residue consists chiefly of pasture, fallow and orchards. Taking the arable land, as above, and we have this result:

	1860.	1861.	1862.	1863.
Arable land.....	5,344,984	5,248,066	5,333,758	4,677,861
Meadow land.....	1,538,562	1,461,018	1,570,252	1,095,489
Orchards, gardens, etc.....	500,000	500,000	500,000	500,000
Pasture and fallow land....	5,666,454	5,850,919	5,679,136	6,277,657
Clover.....				403,884
Flax .....			52,546	95,170
Aggregate .....	13,050,000	13,050,000	13,050,000	13,050,000

This estimate of pasture and fallow land is based on the assumed fact that the total amount of improved land remains the same. The aggregate of pasture and fallow ground seems large; but there are few farms where, after taking the ploughed and meadow land out, there will not remain fully as much in pasture, and a few fields and grounds not ploughed.

The general conclusion we must come to is, that in 1863 and 1864 the abstraction of so large a number of laborers for the army has begun to produce a serious effect in the reduction of culture and of productive crops. Probably the war, if not entirely ended, will be so much reduced in magnitude that labor will hereafter be found in sufficient amount to carry on successfully and prosperously the farming operations of this great agricultural State.

### SECTION 3.—GENERAL REVIEW.

It is quite obvious, from the review of agricultural productions given in my last three reports, that the culture and crops of this State are changing, and that they are likely to change still more. Several articles cultivated are either entirely new or have risen from small beginnings to important results. Of the former class is sorghum, and of the latter tobacco. The culture of flax, clover-seed, potatoes and fruit are all increasing. The production of corn and wheat, the great staple crops, have very nearly, if not quite, reached their limits. Corn cannot be raised profitably except on the rich alluvial soils, and they are now nearly all in cultivation. Wheat requires constant rotation, or, what is equivalent, expansive fertilization. We have not yet arrived at the time when the capital in lands will justify putting an almost equal capital in the renewal of fertility. To avoid that many of the farmers of the middle of the State have resorted to other kinds of production (such as sheep) to change the treatment of their lands; while in the Miami country many farmers now cultivate wheat on the alluvials, which were once exclusively planted in corn. Thus the culture of the State is gradually changing. This is a process which has gone on in all the States as they grew populous. New England, New York and New Jersey have all been declining in the production of grain for many years. This effect will not be as great or as rapid in Ohio, for the entire land of Ohio is arable. We shall continue to raise large crops, and send out large surpluses, but we shall not increase our grain crops in the proportion we have done. We have reached a density of population of more than 60 per square mile, and in a few years shall reach 100 to a square mile. But, in this density of population, it becomes more profitable for small farmers to raise a variety of minor articles for the city markets than to engage in raising grain, hogs or cattle.

Another change, I have noted in the former article, (page ) is in the proportion of labor. Up to the summer of 1863, the war had produced no sensible effect on the market for labor. Labor was abundant in this State, and we had sent out 100,000 laborers before the diminution began to be sensibly felt in the operations of farming. One great reason of this was the introduction of agricultural machinery. The reaper, mower, thresher, &c., &c., have done in this State the work of full 50,000 men. Notwith-

standing this, in 1863 the want of labor was seriously felt, and in 1864 the harvesting could not be got through with without the aid of female hands in many places, and in some it was scarcely done at all. On the whole, however, the harvest of 1864 was safely got in with little loss. In the tables above, made up from the assessor's returns, I have given the aggregates of the crop of 1863. To know the true result I give the *values* of that crop (as determined by the Cincinnati price current) on December 1st, 1863:

	Amount.	Value.	Aggregate.
Corn .....	54,614,517 bush.	\$1·15 per bush.	\$62,818,310
Wheat .....	20,452,400 "	1·28 "	26,179,072
Oats .....	11,317,561 "	0·80 "	9,054,048
Barley .....	1,329,251 "	1·65 "	2,193,263
Rye .....	305,939 "	1·26 "	795,431
Buckwheat .....	200,000 "	1·50 "	300,000
Potatoes.....	5,297,498 "	0·80 "	4,237,998
Hay .....	1,095,489 tons.	28·00 "	30,673,692
Tobacco .....	37,022,323 lbs.	0·30 "	11,106,696
Wool .....	14,000,000 lbs.	0·80 "	11,200,000
Seeds .....	800,000 bush.	— "	2,575,500
Butter .....	31,121,275 lbs.	0·25 "	778,031,150
Cheese .....	19,130,750 lbs.	0·13 "	2,486,978
Molasses .....	2,792,164 galls.	0·60 "	1,675,298
Sugar.....	6,780,000 lbs.	0·15 "	1,017,000
Wine .....	500,000 galls.	3·00 "	1,500,000
Slaughtered animals.	.....	.....	15,000,000
Exported animals...	(600,000)	.....	19,400,000
Total value of agricultural products.....			\$209,993,597

The comparison of the values of produce, with the same values in previous years, is as follows:

In 1861.....	\$136,567,081
In 1862.....	151,863,574
In 1863.....	209,993,597

The gold values have not been materially different. The average premium on gold in 1863, was forty per cent. A gold value of \$150,000,000 would be just about equivalent to the market value of the agricultural products of 1863 at Cincinnati, on December 1st, 1863.

### CROPS OF 1864.

We shall not have the assessor's returns of crops in 1864 till June, 1865. This puts our agricultural tables one year behind all other statistics; but I have heretofore been able to state quite accurately the general ratio of crops, from the observations of intelligent observers.

Below will be found the reports of a number of persons in different parts of the State, which taken together, will give a very correct idea of what the crops of 1864 have been.

■ **BROWN COUNTY** (P. L. Wilson).—Corn crop not more than half an average. Wheat much below—numerous fields plowed up in the spring—a great many not cut at harvest. Oats above an average, though not so much sown as formerly. Rye, barley, and buckwheat, comparatively none sown. Hay above an average. Potatoes not good—an uncertain crop.

Brown county claims to be *the wine county*. Hundreds of acres are planted in vines, and more added annually. The crop was considerably below an average.

*Tobacco*.—Brown county was returned by the assessor as raising 2,684,503 lbs., but Mr. Wilson states that from various causes the returns are below the fact, and the county raised over 3,000,000 lbs, and that in 1864 the crop was not over two-thirds of that.

In answer to “What *causes* have diminished the crops?” Mr. Wilson says: “Last spring was very wet and cold; corn could not be got in till very late. Then came the drouth, and stopped vegetable growth till late. A very wet fall; corn kept green till killed by frost. Tobacco, potatoes, &c., affected by the same cause.” As to labor, Mr. W. says: “Considerable difficulty was experienced in many sections in getting hands to work, particularly in corn planting and harvest. The women turned out and did a large amount of labor.”

**CLERMONT COUNTY** (Otis Dudley).—“Below is the result of such inquiries as I have been able to make:

1. Corn, about three-fifths of an average crop; wheat, nearly full; oats, full; potatoes, nearly full.
2. The *cause* of diminished crops were, drouth, early frost, and scarcity of labor.
3. Labor—much inconvenience felt for want of it.
4. Tobacco is grown to a considerable extent in the southern part of this county. The crop of 1864 will be about half the amount of the preceding year. Hay was nearly an average crop.”

**LOGAN COUNTY** (A. Sanders Piatt).—1. The condition of crops in this county is below the average. 2. The wheat and other winter grain were injured by the sudden change of temperature to extreme cold. Other crops were injured by extreme heat and drouth to one-half below the average. 3. Labor scarce and costly, in many instances impossible to get at any price. 4. Tobacco is not grown in this county, at least not much.

**BUTLER COUNTY** (J. M. Millikin).—The crops of 1864, with the exception of corn, were in this county a very fair average. Corn was very seriously injured by a very severe drought. The average for Butler county could not exceed 25 bushels per acre—probably not over 20 bushels. There has been some inconvenience in procuring labor. While that is true to a limited extent, it is nevertheless true that the harvest of 1864 was secured in less time, and in as good order, as any harvest has ever been. This favorable result was accomplished, notwithstanding the withdrawal from agricultural labor of a large portion of the regiment of

National Guards, which went into the service from this county. Several causes produced this favorable result.

1. The weather was exceedingly favorable. 2. The grain ripened regularly and evenly, uninjured by storms. 3. Agricultural implements and machinery were generally brought into use. 4. Farmers had been apprehending great difficulty, and hence great vigilance and industry were practiced. The result was, that the grain and grass in this county was cut and taken out of the field in as good order and as quick time as it has ever been since the settlement of the Miami Valley.

Tobacco is grown in this county to some extent. There was not as much grown in 1864 as in the two or three previous years. The great care and labor necessary to its culture—the uncertainty of the crop—the necessity of experience and judgment in preparing it for market—its liability to damage, and the expense necessarily incurred in erecting houses and sheds, have all combined to convince some of our people that it is neither the most desirable or profitable to raise.

GALLIA COUNTY (A. P. Rodgers).—Wheat very poor yield and quality not over one-fourth of a crop; killed in winter and red midge. Corn about two-thirds of a crop. Oats good—over an average. Hay one-fourth better than last year. Potatoes a two-thirds crop. The causes of bad crops were drought, winter killing, and midge.

No want of labor; contrabands from Dixie plenty.

Very little tobacco raised in this county.

LAWRENCE COUNTY (D. Nixon).—The crops of 1864 in this county were about four-fifths. The causes—want of labor, and drought. Great inconvenience has been felt for want of competent labor. A small quantity of tobacco was raised in this county in 1864—about 15,000 lbs.

LAKE COUNTY (J. Coolidge).—Grass a short crop; wheat light; oats and barley poor; corn and potatoes good. In nature's rotation, this has been one of our corn seasons. Potatoes were 25 per cent. above par, but in an unhealthy condition. Apples and small fruit at par, but no peaches.

The first week in January, 1864 (the period of great storm and cold), was very hard on wheat, and most of the meadows—especially clover. The ground was bare of snow and very cold.

No difficulty on account of deficient labor. We never had more acres in tillage, and it was never better cultivated and harvested; but it took all our help, old and young, male and female, to accomplish it. Hired help was two dollars per day when we could find it. The township of Perry, with less than 300 voters, sent into the army over 200 of our best field laborers; yet our farming was never done better, and we rejoice that we have been able to do so much for our country and ourselves.

No tobacco, that I can find. This crop was a failure, mostly on account of frost. The sorghum crop was of good quality and increased quantity. The syrup was better than ever before.

MUSKINGUM (G. Arthur, Auditor).—Crops, from the best information I can get, were about one-third of what we would call a good crop—grain, hay, potatoes, &c., &c. Some uncommonly good fields of wheat; but on the uplands it was generally destroyed.

The causes of diminished crops were drought and worms—except wheat, which was killed by the extreme cold of winter. Very sensible inconvenience has been felt for want of labor.

But little tobacco is grown in this county.

WARREN COUNTY (Mr. Anters, of Union Village).—Wheat about an average in quantity; greater amount sown, but a little shrunk by rust. Corn a little short, occasioned by drought. Oats perhaps two-thirds or three-fourths crop—shortened by drought. Grass a good crop—rather over the average. Potatoes not over half a crop—affected by drought. Tobacco considerably cultivated, but last year's crop almost a failure for want of rain. Apples not over half a crop. Peaches none.

Considerable want felt for labor in harvest. Since that time, not much want experienced.

From these statements, we may conclude that the corn crop is again much reduced—probably not exceeding *two-thirds* of an average crop—not much exceeding 50,000,000 of bushels; that the wheat crop is below an average, but on the whole a pretty good one. Potatoes is below an average; but oats and hay are a full crop. It will probably be found, when the results are ascertained by the assessors in the spring, that the crops of 1864 were no better than those of 1863. It is now the winter of 1864–5; and the uniform coldness of the winter and the abundance of snow, is, so far, a preparation for an abundant crop in the year 1865; and without some extraordinary change of seasons, such it should be, from the deductions to be made from statistics. The cycle of bad years is now finished, and we should be entering upon a series of good and abundant harvests.

---

#### ARTICLE IV.—MINING.

The amount of iron and coal mined in Ohio, and returned in the United States census of 1860, was as follows:

Number of furnaces .....	53
Tons of pig metal mined.....	110,056
Value of pig metal.....	\$3,204,686
Bushels of coal mined.....	25,433,200
Value of coal .....	\$1,554,203

The return contained obvious errors. There was not a bushel of coal returned for the counties of Carroll, Coshocton, Harrison, Gallia, Holmes, Jefferson, Morgan, Noble, Scioto, Stark and Vinton counties, in all of

which coal is mined, and in three or four of them in immense quantities. In my report for 1860 (page 29), the quantity of coal mined, on the authority of inquiries made by the Auditor, was 50,000,000 of bushels (double that of the census), and I believe that it was not overstated. In the Auditor's Report for 1864, in the returns made by the assessors, there are also obvious errors, so great that they can hardly be accounted for. For example, take the following: The counties of Gallia, Mahoning, Muskingum, Stark, Trumbull and Vinton, which together have *nineteen furnaces*, are represented as having produced no iron at all! In fact, the tabular reports of iron and coal in this State, furnished by the United States Marshals or the State Assessors, have both hitherto been erroneous. The most correct account of our mineral productions have been given in my reports. In fact I have no reason to doubt their accuracy, for in nearly all the counties returned, the returns were made up by intelligent individuals on the spot, who made personal inquiries. No doubt the interruption occasioned by the war and the diminution of labor have caused a great fluctuation in the production of iron and coal, yet I think that the great demand for these articles in 1864, must have occasioned a revival of mining in the coal districts. The number of *furnaces* in the State is at least 55, if not more. The number out or in blast I cannot tell. If they were all going, they would produce 110,000 tons of pig metal.

I shall report here the statistics of iron given in my report for 1860, viz.:

In the following tables will be found the results of twenty years progress :

#### 1. OF IRON.—

	Furnaces.	Tons of Pig-iron.	Hauds.	Value.
In 1840 .....	19	25,959	1,257	\$648,975
In 1850 .....	35	52,658	2,415	1,255,850
In 1860 .....	59	105,500	5,000	3,171,000
Increase since 1850.....100 per cent.				

The great increase of furnaces and iron products was in the counties of Jackson, Lawrence, Vinton, Mahoning and Trumbull.

5. OF COAL.—The following table shows the amount and value of coal dug in the same periods of time :

	No of Bushels.	No. of Men.	Value.
In 1840 .....	3,513,409	434	\$286,072 72
In 1850 .....	8,000,000	1,100	720,000 00
In 1860 .....	50,000,000	7,000	5,000,000 00

In 1857, the receipts of coal at Cincinnati and Cleveland were 24,000,000 bushels. The receipts at Portsmouth, Chillicothe, Columbus, Newark, and many other interior places, for domestic consumption, was alsolarge. About 10,000,000 bushels of coal are consumed in the iron furnaces, and by the population around; but, as yet, a small part of this only is bitu-

minous; most of it is charcoal. In future, it is possible that bituminous coal will come into use, and thus largely increase the mining of coal.

Notwithstanding twenty counties of Ohio are underlaid with coal, and most of these intersected by railroads or bounded by the Ohio river, yet we have seen such a thing as a coal famine in the city of Cincinnati. Coal, which in the United States census is returned at 6 cents per bushel, and which, allowing for carriage and the depreciation of the currency, ought not to have exceeded 20 cents per bushel, sold at from 40 to 60 cents during the greatest part of the winter. Nothing can illustrate better the want of forethought, organization and economy which belongs to old communities, than such a fact as this. Coal, in ordinary times, can be furnished in Cincinnati at 10 cents per bushel, and gives a handsome profit to both miner and dealer. Not less than 10,000 square miles in Ohio is a coal region, having some of the finest qualities of coal to be found in any district of the world.

3. OF SALT.—The salt produced in Ohio, at different periods, were as follows:

	Bushels.	Value.
In 1840.....	297,350	\$89,295
In 1850.....	550,350	132,293
In 1860.....	2,000,000	500,000

The increase in the manufacture of salt since 1850 has been 250 per cent.; and it is probable the increase will continue, since we still import large quantities of foreign salt which may, and probably will, be supplanted by our own.

The manufacture of salt has undoubtedly increased, and I think the total amount is not less than 3,000,000 bushels.

PETROLEUM is found in the State, but in what quantities is yet unknown. The geological theory of petroleum is yet unsettled, but it is believed that this oil will be found in the same rock formation as salt, and salt water may be found in a much more extensive region of Ohio than is generally supposed. Many places where salt water was found half a century ago, were abandoned because stronger water was found in other places, and the weakness of the water originally found was because the wells were too superficial. The boring had not reached the saliferous. It is supposed that the same kind of rock is that which contains the oil. In many of the salt springs, oil has been found to come up with the water. It is now found that the saliferous rock must be reached in most localities by boring from 1,000 to 1,200 feet in depth. It is probable that, on the hypothesis that the oil actually exists in an extensive section of country, that it must be reached generally at a depth of 1,000 feet. In that case

cannot be known, till after many experiments, how rich or how extensive the oil deposits are. Rock oil was found in the first settlement of the

State on the Muskingum and its tributaries, and it has recently been found in other localities. At this time the section of the State in which petroleum is mostly sought, contains the counties of Washington, Athens, Meigs, Morgan, Muskingum, Licking, and the adjacent region. The field of operations will probably be extended as experiments are made.

The production and export of rock oil from the wells already operated in the United States, are so great that we can form no idea of the limit to which it may be produced. Probably not a tenth of the land bought for petroleum will yield anything, but if it be found in various sections the ultimate product must be immense. In the year 1864, *thirty-one millions of gallons were exported*. It was carried to every part of the world, and is used for almost all purposes. There must of course be a limit to the demand, but it is obvious it will continue far beyond the present production.

The review of our mineral productions will show that while we produce neither gold or silver, tin or copper, we do produce far the most useful minerals either for domestic economy or manufactures. Coal, iron, salt, freestone, limestone, gypsum and petroleum, we have far beyond any demand which the people of this State will ever have for them.

---

#### ARTICLE V.—DISTRIBUTION OF PROPERTY.

The distribution of property and the mode of its taxation, are among the most important facts which concern the economy and comfort of a people. How much property have the people of Ohio? How is it distributed? How is it assessed for taxation? What taxes does it bear? and, in what proportion? And in what proportion does wealth advance, in proportion to population? These are problems which must be solved, in order to determine the increase of property and the advance of wealth in any State. In answering these questions, I remark: 1. That the natural elements—its quantity of land, the strata of minerals, and the navigable waters—remain the same; but, 2. That *labor, inventions, machinery and commerce* have added to the value of these elements in such a manner that their *value* (whether intrinsic or relative) is greatly increased; in other words, these elements, from being purely natural, are made artificial and valuable by being applied to the uses of society; and 3. That the more society advances in arts and population, the more the *uses* of property increase, and the more valuable it becomes. This is the basis of what is called wealth, which is created by what is called *developing the resources* of a country. Its elements are natural; their development is artificial.

Ohio is mainly an agricultural State now; but the time is not remote when it will be very largely a mining and manufacturing State. This re-

sults necessarily from the very extensive mineral resources described in Art. 4. To get a correct view of the property, wealth, and progress in Ohio, I shall consider chiefly its proportion and distribution, under several heads.

### 1. LANDED PROPERTY AND ITS DISTRIBUTION.

The total quantity of land in Ohio is 25,376,960 acres. The quantity returned for taxation in various years, as appears from the Auditor's reports, were :

In 1841 .....	21,041,784 acres.
In 1845 .....	23,456,486 "
In 1850 .....	25,220,083 "
In 1855 .....	25,220,083 "
In 1860 .....	25,316,099 "
In 1861 .....	25,321,705 "
In 1862 .....	25,329,580 "
In 1863 .....	25,360,407 "
In 1864 .....	25,341,345 "

There is still a small quantity of land, owned by the Government, or the State, and in some cases individuals, which is not taxed. The valuation of these (including all town property) was, at different periods, as follows :

	Value of Real Estate.
In 1841 .....	\$100,851,837
In 1845 .....	103,185,744
In 1850 .....	341,388,838
In 1855 .....	578,858,539
In 1860 .....	639,894,311
In 1861 .....	643,885,552
In 1862 .....	645,670,080
In 1863 .....	649,500,022
In 1864 .....	655,498,100

In 1864 the town lots were valued at \$157,276,511. In my report for 1860, (page 4,) I showed that the surface occupied by lots was 28,333 acres, and the surface occupied by roads 425,000 acres, making 453,333 acres, which should be deducted from farming lands. Deducting average quantity of 450,000 acres from each of the returns in 1850, 1855, 1860 and 1864, we have the average of *assessed values* of lands in Ohio, as returned by the assessors, to be :

In 1850 .....	\$10 33
In 1855 .....	17 62
In 1860 .....	19 70
In 1864 .....	19 98

It is evident that the value of lands has not been assessed with any reference to the changes in the currency, for there has been but slight increase in value since 1860. In the fourteen years since 1850, however, the assessed value of lands was doubled. This shows a great advance in agricultural wealth; but it will be seen above, that the increase in four years has been scarcely anything; and this corresponds with what I have shown above, in relation to the crops, that since 1860 they have steadily declined—partly owing to natural causes, and partly to the war. The reduction in the number of laboring men has begun to be sensibly felt.

The *distribution of land among individuals* is, perhaps, more important than that of its aggregate quantity. If wealth, however great, is in the hands of few persons, the great majority must be in want; and government fail as to its great end—the happiness and prosperity of the people. In England, landed property is in the hands of comparatively few people, in consequence, originally, of the entailed estates, and then of the law of primogeniture. In this country we have neither of these laws, and therefore the inheritance of estates is equal, and the transfer, by sale, is free to all. In the course of time, this may work the opposite extreme—that of reducing farms below the size at which they can be well cultivated; for farming can only be well cultivated where there is enough land to admit of some rotation in crops. In France, farms are generally reduced to so small a size as to injure cultivation. In Belgium, a country of very dense population, farms are also reduced to a very small size; but much of the culture there is spade or garden culture, so that Belgium is said to be in most excellent agricultural condition. It will be very long, probably at least a century, before the sub-division of lands here will occasion any serious mischief. Heretofore this sub-division has been of great advantage. In the census of 1850, the average quantity of land held by each landholder was given at 125; but in my report of 1862, the quantity of lands held by each owner of lands (exclusive of lots) was found to be 90 83-100; and the number of owners to be 277,000, of whom 240,000 were estimated to be actual farmers. It is evident, therefore, that Ohio is still mainly an agricultural community.

Taking the whole valuation of lands (exclusive of town lots) to be (as above) in round numbers, *five hundred millions of dollars* (\$500,000,000,) divided equally among 277,000 owners, the *average* to each man is \$1,841. Looking at this as a working capital for a working man, it is no doubt sufficient for a comfortable support; but when we consider (what is the fact) that the real marketable value is double that sum, it proves, what general observation confirms—that the farming population of Ohio are not only in a comfortable, but, comparatively speaking, in a wealthy condition.

## 2—PERSONAL PROPERTY AND ITS DISTRIBUTION.

The valuation of real estate (which is stated above), being \$655,498,100, the aggregate value of all personalities was \$351,198,016, making the whole aggregate of property \$1,006,696,116. The increase of personal property in the last fourteen years, were as follows:

In 1850 .....	\$98,487,202
In 1855 .....	283,118,815
In 1860 .....	248,408,290
In 1862 .....	243,615,212
In 1863 .....	286,871,222—increase 18 per cent.
In 1864 .....	351,198,016—increase 24 per cent.

In fourteen years the advance in the value of personal property was 250 per cent., a much greater ratio of increase than that of real estate. This is accounted for, in a great measure, by the fact that the *prices of the day*, which are regulated in a great degree by the increase of currency, are put on all personal property, which is not the fact with real estate. We see in the preceding section that the assessors have not varied the price of land at all, while the price of personal property has been raised 50 per cent. in two years. This shows that, while the value of currency is so very fluctuating, all attempts at equalizing the values of property are in vain. The value of various kinds of personal property are as follows. Here I remark that there are several kinds of personal property which are inseparable from real estate; they are attached to it, and a necessary part of it. Of these the stock on farms and railroads, are the principal. I shall distinguish them thus:

1. *Of Personalities attached to the Realty.*

The valuation of these in 1864 was:

Horses .....	\$39,111,011
Cattle .....	18,367,055
Mules .....	1,106,241
Sheep .....	17,592,657
Hogs .....	4,994,234
Railroad, (returned in each county) .....	41,814,330

Chattel property attached to realty.....\$122,705,528

2. *Personal Property not attached to the Realty.*

Watches and pianos .....	\$3,493,360
Merchants' stock .....	35,576,697
Manufacturers' stock .....	12,460,455
Money .....	47,811,311
State Banks, capital .....	4,408,820
National Banks, capital .....	6,000,000
Private Banks, capital, (per table) .....	2,200,000
Gas and Coke Companies .....	1,283,000

Express Companies .....	\$191,746
Miscellaneous companies, including Telegraph Companies, Bridge Companies, etc.....	1,647,066
Credits, Book Accounts .....	53,951,082
All other personal property not included in the above enumeration, and subject to taxation .....	44,412,611
	<hr/>
	\$213,436,148

In addition to this there are stocks not subject to taxation, \$9,185,423, making the entire aggregate property of the State, as returned by the assessors, \$1,015,882,539, and the whole amount of personal property, (exclusive of that attached to the realty,) only 22 per cent.

The relative proportions of different classes of property, as attached to the leading occupations, are as follows :

Agricultural population, including farms, and the stock, and the roads thereon.....	\$620,927,117
Citizens of towns, houses, lots, gas, street railroads, etc. ....	168,751,257
Manufactures' and Mechanics' capital .....	12,460,455
Merchants' and Bankers' capital, (exclusive of money)	103,611,345
Miscellaneous, (including money) .....	110,132,365

The largest part of the last item consists of money and furniture, carriages, watches, etc.

It appears that the wealth of the State, in different classes, is apportioned thus, (supposing the money, furniture, etc., to be apportioned pro rata) among the different classes of occupation ; viz. :

Farmers .....	68 per cent.
Inhabitants of towns .....	19 per cent.
Manufacturers' and Mechanics' capital .....	24 per cent.
Merchants' and Bankers' capital.....	11 per cent.

A glance at these ratios will surprise us, at the small relative amount of capital invested in the useful arts. But this will be somewhat abated by reflecting on two facts: *first*, that a large part of the capital invested in manufactures and mining, consists of real estate; mines in the country, factories and shops in town, and this property is placed under the heads of lands and lots; and, *secondly*, that the largest part of the investment in the manufactures of towns is put in labor, and makes up the weekly expenses, paid out of the products of the manufacture. Hence, the amount of active capital required, is much less in proportion than in other kinds of business. Notwithstanding these considerations it is quite evident that Ohio does not yet figure as a manufacturing community; yet, as I have observed, such are its great mineral resources, that the time is near when mining and manufactures must be largely and rapidly developed.

## 3.—OF BANKING IN OHIO.

The amount of bank capital is stated in the above account of property, and as I gave a very full and detailed statement of the banks in my last report, (*vide* pages 29-37,) I shall confine myself to general statements of their condition now. The following is a view of the operations of the State Banks, (State, Free and Independent,) in 1863, taken from my last report. It is exclusive of the National Banks, whose operations I have, at present, no means of ascertaining:

## COMPARATIVE CONDITION OF ALL BANKS IN OHIO ISSUING CIRCULATING NOTES.

Number of banks.	Capital.	Circulation.	Deposits.	Discounts.	Specie.
In 1855....60	\$5,677,740	\$9,151,340	\$4,849,209	\$13,079,685	\$1,934,482
In 1860....55	5,861,364	8,534,887	5,210,403	12,247,501	2,001,219
In 1863....56	5,052,940	6,652,311	11,405,439	11,366,451	1,828,591

The general movement from 1860 to 1863 (the period of the war) is as follows:

Decrease of capital.....	\$800,424
“ circulation.....	1,882,576
“ discounts.....	881,050
“ specie.....	172,628
Increase of deposits.....	6,195,036

The total diminution of *means* (that is capital, circulation and specie) is \$2,863,628. The diminution of discounts being only \$881,050, shows that about \$2,000,000 derived from deposits were used in the discounts. But this was less than one-third the actual increase of deposits, showing that the banks were moving with great caution. Accordingly we find that in December, 1863, at the period of the last report, the banks held, including specie, seven millions (\$7,000,000) in cash and eastern deposits, while their circulation and deposits were \$18,000,000, thus holding 35 per cent. of the immediate liabilities in cash.

The great and striking feature of the Bank movement, in the last three years, is the *increase of deposits*. These have *more than doubled*, being an actual increase of \$6,195,036. When we consider the circumstances of the country, this increase is, beyond doubt, the direct consequence of the war. The war has produced *three* results in financial operations, which are strikingly obvious in all the business operations of the country: 1. An immense increase of the currency coined, by the issue of Government notes. 2. A great diminution of credits, which is proved, incontrovertibly, by the diminution of recorded debts, the diminution of imports since 1859-60, and the diminution of discounts. 3. As a direct consequence of the last fact, a larger amount of cash on hand is required for the transaction of the business of the country.

How far this state of things continues, we shall soon determine.

In November, 1864, the account stood thus:

No. of banks.....	47
Capital.....	\$4,408,829
Circulation.....	5,116,471
Desposits.....	11,115,818
Discounts.....	9,436,994
Specie.....	1,180,802

This presents the following results, compared with those of last year, viz.:

Decrease of banks.....	9
“ of capital .....	\$1,268,920
“ of circulation .....	1,535,870
“ of deposits.....	250,621
“ of discounts.....	1,939,457
“ of specie.....	647,789

This proves, in regard to the incorporated banks of Ohio, precisely what is quoted above from last year's report, that the *cash in hand* has very largely increased; for while there are *nine* banks less in number, and the capital, circulation and discounts have all greatly diminished, the *individual deposits* have remained nearly the same, that is, comparatively, much larger. In the meantime, many National Banks have been formed, and several of the incorporated banks become National Banks. The deposits in all classes of banks have been increased several millions, and the aggregate of deposits is probably ten millions greater than it was at the beginning of the war.

The formation of National Banks has continued to go on in Ohio, and it is not improbable that all banks (except private banks of deposit) will be organized under the National law.

## 2. OF PRIVATE BANKS.

What are called Private Banks are those in which individuals open a banking office, receive deposits, make loans and buy exchange. Of these banks (generally of small capital) I can, of course, get no account, except from the returns they make to the County Auditor for taxation. These give, however, a tolerably correct view of them. Generally they have very small capital and depend for their profits on managing the money of other people. Last year the aggregate of these banks was:

Number of banks .....	99
Capital employed.....	\$2,019,336

The following is a table of the returns, made by the County Auditors to me, for 1864:

Counties.	Number.	Capital.
Adams .....	2	\$22,800
Ashland.....	1	12,375
Brown .....	2	32,000
Clinton .....	1	12,000
Cuyahoga .....	4	68,061
Defiance .....	1	3,000
Fayette .....	1	9,026
Franklin .....	5	66,867
Greene.....	1	41,952
Guernsey.....	1	5,118

Counties.	Number.	Capital.
Hamilton.....	25	\$1,564,510
Highland.....	1	40,000
Jefferson.....	1	25,000
Licking.....	3	92,102
Logan.....	2	.....
Lucas.....	1	15,000
Madison.....	1	20,000
Montgomery.....	2	18,730
Pickaway.....	1	44,500
Marion.....	2	44,268
Scioto.....	3	39,353
Seneca.....	2	20,000
Tuscarawas.....	1	4,200
Union.....	1	6,384
Warren.....	2	25,880
25 Counties.....	67	\$2,233,131

It will be seen that while the number of these banks has diminished the capital has increased. In fact, the aggregate of bank capital in Ohio has increased largely.

#### ARTICLE VI.—STATISTICS OF WAR.

Under this head I have given, in the last two years, the statistics of Internal Revenue; of the main Hospitals in Ohio; and of the Losses by War. These involve very interesting problems, which we can only partially solve now; but hereafter the facts in relation to these subjects will form the material of very important investigations. I give here a continuation of such statistics on these subjects as I can obtain.

##### 1. OPERATION OF THE INTERNAL REVENUE IN OHIO.

In my report for 1863, I gave as much of the statistics of Internal Revenue as I could obtain, which, however, was very defective, being for nine districts only. Taking the ratio of these districts, I made an estimate for the whole, which proved to be extremely accurate. In order to present the whole subject fairly, I shall re-produce here the statistics of Internal Revenue, from the report of 1863 (pages 43-45), viz. :

	Whole Revenue for year ending Sept. 1, 1863.	Income Tax.
1st Dist. C. R. Fosdick.....	\$1,379,358 00	\$270,000 00
2d " J. Pullan.....	996,384 00	217,685 78
3d " W. Miner .....	477,225 09	69,007 11
4th " James A. Walker.....	335,879 96	34,000 05
6th " David A. Sanders .....	115,250 09	18,849 57
8th " C. S. Hamilton .....	71,691 49	18,328 71
19th " Horace T. Beebe.....	119,512 67	24,782 16
15th " J. R. Waters .....	108,576 28	10,883 01

Total nine districts .....	<u>\$3,750,700 06</u>	<u>\$707,393 81</u>

If we exclude the two Cincinnati districts, the average of the other seven will be nearly the average for all the districts, exclusive of Cincinnati.

Seven districts give \$1,374,958, which is an average of \$196,422 each. The seventeen districts, exclusive of Cincinnati, give \$3,339,174, which, with the Cincinnati districts (as above), give \$5,714,918, for the State. This is exclusive of some amounts on liquor, that would be paid after the 1st of September. The aggregate internal revenue for the State of Ohio, for the year ending September 1, 1863, was, in round numbers, *six millions of dollars*.

If, now, we average the income tax in the same manner, we find that, exclusive of Cincinnati, the income tax was \$531,209 17; and with Cincinnati, the income tax for the whole State was \$1,018,894 95.

The reports for these districts show the following amounts of liquor, and the tax on it:

	Amount.	Tax.
1st District .....	.....	.....
2d " .....	1,730,239 gallons.	\$346,047 80
3d " .....	856,311 "	171,262 18
4th " .....	1,244,325 "	248,865 20
6th " .....	120,543 "	24,108 75
8th " .....	61,208 "	12,241 65
12th " .....	1,160,686 "	62,847 86
15th " .....	462½ "	92 50
19th " .....	8,873 "	1,774 60

In connection with the duty on liquor is that of the license for retail, and this has been quite a productive source of revenue. No amount of tax seems to be sufficient to prevent men from ruining others, by the retail of liquors, and, therefore, it is quite safe to levy almost any tax which can be collected. In my report of 1858, I made the number of "drinking houses" in this State (from carefully-prepared returns) 6,500. In Cincinnati the number was ascertained by the police, and the aggregate number was very nearly accurate. The following returns, derived from the assessors, will show how far these shops have increased:

	In 1858.	In 1863.
1st and 2d Districts.....	1800	2426
3d District.....	622	562
4th ".....	202	316
6th ".....	19	359
8th ".....	144	227
12th ".....	366	794
15th ".....	130	251
19th ".....	101	296
Total.....	3444	5231

The above statement shows that since 1858 the number of retail drinking establishments has increased 50 per cent., and must now number at least 10,000. Strictly, the increase is much more, since the *hotels* are not included, and they number nearly 2,000, most of which retail liquor.

It also appeared, from an investigation made for that purpose in 1863, in one of the districts, that of 1,160,686 gallons of whisky actually distilled, a tax was collected on only 310,000 gallons! This shows the effect of exempting the stock on hand from taxation. In my report of 1863, I also remarked, that "*if Congress made a very high excise the amount manufactured will be reduced to 12,000,000 gallons, on which the duty, at the proposed rate, will be seven millions (7,000,000 of dollars.)*" This was a prophecy derived from statistics, and it was fulfilled to the letter. It will be seen from the table of Internal Revenue, stated below, that Congress having actually put a high duty on liquors, the sum derived from the tax on whisky was just seven millions, within a small fraction. I should here say, that the statistics of internal revenue are kindly furnished to me by the officers of the U. States, having the matter in charge, without any obligation to do it. They, as well as many others, have furnished me with much information which I could have obtained in no other way:

*Table of Internal Revenue in Ohio for the Year ending September 1, 1865.*

District.	Tax on Whisky.	Tax on Income.	Total U. S. Tax.
1st District .....	—	\$300,283 } Special, 378,936 }	\$2,317,124
2d " .....	\$1,733,506	348,158 } Special, 454,291 }	2,607,539
3d " .....	1,175,402	135,084	1,582,458
4th " .....	659,544	55,783 } Special, 73,641 }	777,822
5th " .....	109,031	—	203,982
6th " .....	439,419	—	593,310
7th " .....	896,308	—	1,230,461
8th " .....	24,535	—	100,893
9th " .....	531,259	—	606,305
10th " .....	5,815	45,000	382,713
11th " .....	420,166	—	605,325

District.	Tax on Whisky.	Tax on Income.	Total U. S. Tax.
12th " .....	657,998	70,284 } Special, 108,679 }	825,409
13th " .....	261,620	.....	455,866
14th " .....	35,473	29,305 } Special, 48,839 }	226,560
15th " .....	237	29,305	186,963
16th " .....	—	—	—
17th " .....	—	—	—
18th " .....	96,634	167,114 } Special, 236,310 }	912,828
19th " .....	2,979	24,784	200,339

Comparing the only districts of which I had returns last year, with the same districts this year, we have the following result :

District.	1862-'3.		1863-'4.	
	Whisky Tax.	Total.	Whisky Tax.	Total.
2d Dist. ....	\$346,047	\$996,384	\$1,733,506	\$2,607,539
3d " .....	171,262	477,225	1,175,492	1,582,458
4th " .....	248,865	335,879	659,544	777,822
6th " .....	24,108	115,250	434,419	593,310
8th " .....	12,241	71,691	24,535	100,893
12th " .....	62,847	146,822	657,998	825,409
15th " .....	92	108,576	237	186,963
19th " .....	1,774	119,512	2,979	200,339
Total.....	<u>\$867,236</u>	<u>\$2,371,389</u>	<u>\$4,688,706</u>	<u>\$6,874,733</u>

It will be seen that the whisky tax has increased 400 per cent., and the aggregate 200 per cent. Deducting the whisky tax in each of the above districts, I find the increase of internal revenue, in each district, to be in the following proportions, viz.:

2d District.....	increase 34 per cent.
3d " .....	" .. 33 "
4th " .....	" .. 35 "
6th " .....	" .. 75 "
8th " .....	" .. 30 "
12th " .....	" .. 100 "
15th " .....	" .. 70 "
19th " .....	" .. 70 "

The increase in the aggregate sum raised in Ohio by the Internal Revenue Tax, from 1863 to 1864, was 160 per cent. In this, however, I count from the 1st of September; for that was the date of this tax; but the returns to the Government terminate now on the 30th of June—that being the end of the fiscal year. The following tables are from the reports made to the Government, showing this revenue up to the end of the fiscal year.

## AMOUNTS COLLECTED IN EACH STATE.

The amount of collections from each specific source of revenue in each State, as compared with the ten months ending June 30, 1863, is given as follows :

STATES.	Total collections for fiscal year ending June 30, 1864.	Refunded.	Net total.
Maine .....	\$1,172,021 94	\$7,335 35	\$1,164,686 59
New Hampshire .....	1,003,957 58	4,157 41	999,800 17

Utah .....	6,140 96	19,889 10
Colorado .....	21,078 85	61,638 69
Nevada .....	22,904 61	162,688 94
Washington .....	15,160 57	37,412 16
Total.....	\$34,769,257 73	\$136,983,422 83

The total amount raised in Ohio, for the year ending 30th June, 1864, for Internal Revenue, was \$11,802,272.

The total amount raised (per my table above) for the year ending September 1st, 1864, and making a proportion for two absent districts, is \$14,860,003.

It will be seen, from this, that the increase of revenue for the months of July and August, 1864, *above the corresponding months of 1863, was* \$3,057,731.

In consequence of the increased whisky tax and the better execution

of the law, it is probable that the same rate of increase will continue during the current year of 1864-5. In that case the total amount of Internal Revenue raised in Ohio during the current year, deducting the Special Income Tax of 1863, will be \$28,148,878.

The Internal Revenue raised during the last fiscal year, from various sources of taxation, in Ohio, for the year ending July 1, 1864, were as follows :

From whisky.....	\$6,442,408
“ fermented liquors .....	209,685
“ cigars.....	115,650
“ iron .....	208,546
“ oil .....	241,136
“ all other manufactures and products .....	2,235,335
“ Income Tax .....	1,117,691

Some inferences may be drawn from the above facts, in regard to the future operation of the Internal Revenue Tax in Ohio.

1. Notwithstanding the very heavy tax laid on whisky, in the winter of 1863-4, it did not sensibly diminish the consumption of liquor ; and it is not probable that the consumption will be diminished much below the present amount ; but the tax in 1864-5 will average double that of 1863-4. If we suppose, however, that the sales of liquor are really reduced one-third, the double tax will produce over \$9,000,000 in revenue.

2. We find in the above statistics, that in consequence of not taxing the stocks on hand, a large part of the whisky made in the early part of 1864 never paid the enhanced tax. It is probable that more than one-third the whisky made in 1864 never paid the increased tax. Taking these facts into consideration, I think it evident that the tax on liquors in Ohio will yield the Government in 1865, full \$12,000,000.

3. Ohio is very nearly *one-tenth* in population of the loyal States (twenty-five), and we see from the tabular view (above) of the revenue in all the States, that Ohio pays about a tenth of the Internal revenue. In this respect she stands just where her population indicate that she should stand. When we leave Ohio, this rule of proportion ceases. Massachusetts rises at once above Illinois and Indiana, which are much more populous. This is because the bulk of taxation is laid on manufactures and incomes, both of which are much larger in proportion than in Illinois and Indiana. In Ohio wealth is very equally diffused, yet there is a great difference between the city districts and others ; and this is owing to the same causes as in Massachusetts—that manufactures predominate there.

4. With the data I have furnished above, I think the internal revenue raised in Ohio for the year ending September 1, 1865, will not be far from the following sums, viz :

On whisky.....	\$12,000,000
On incomes.....	1,500,000
On all other things .....	10,500,000
Total .....	<u>24,000,000</u>

This is based on the supposition that there will be no other alteration in the tax laws which will materially affect the subject of taxation in Ohio.

## SECTION 2.—LOSSES OF MEN IN WAR.

In my report of 1863 (pages 40, 41), I made an estimate of the number of men lost in the war, from Ohio, which proved so singularly accurate, that it furnishes strong testimony to the value of statistics in furnishing data on which the future movements of society may be predicated. I shall here reproduce the facts then stated, and add to them others obtained since. In regard to the loss or increase of able-bodied population, I remarked that there are two ways in which we can ascertain whether able-bodied men are increasing or diminishing: 1. By political statistics, (the number of voters); 2. By an estimate (on given data) of the actual losses in war, as compared with the gains in peace. Since then the election of Nov. 1864 has furnished us with some new facts; and under a new law of the State, the assessors have, as far as possible, ascertained the number of men lost in the war—in the actual army. We have thus a series of facts, which will enable us to determine on different classes of data the loss and gain of able-bodied men since 1860.

The Presidential elections of 1860 and 1864 give these results:

In 1860, whole vote.....	442,441
In 1864,       “ .....	470,532
Actual increase .....	<u>28,091</u>

But we must take into consideration some other elements in order to ascertain the real facts. Ohio has an army, enlisted under the Government, in numbers not materially different from 100,000 men. Of these men but few more voted than those who were at home on furlough, on parole, or in hospital. Those who were prisoners in the enemy's hands, and those who were on immediate duty at the front, could not have voted. In point of fact, the number of soldiers' votes included in the above Presidential vote, was 50,713. We may assume that 10,000 more were at home or in the hospitals of Ohio, so that there were 40,000 soldiers who did not vote. I cannot believe this is too large a number. We have then 68,000 voters more than in 1860. Call it 60,000, and we have at the ratio of  $5\frac{1}{2}$  persons to each voter—a very small ratio—an increase of 330,000 in population, and 60,000 in able-bodied men. This is a larger increase than I estimated in my last report, but there is reason to suppose, on the data I have

furnished above, that we have received a large increase of population since 1860. Since that period we have received in this State from 80,000 to 100,000 immigrants from Europe. The tendency of the war has been to throw a great many refugees from the South among us, and retain among us many who might otherwise have left the State. At any rate it is in vain to deny that the population of Ohio has largely increased in spite of all the supposed adverse influences of the war.

The data on which the *losses* of men in the war are calculated, I gave in my last report, and are as follows, viz :

“The returns of the United States Army Hospital Reports show that, in one year, there are 70 per cent. of the whole number of men sick, and of those sick, 1 in 119 die :

Whole number of men ( <i>average</i> ).....	120,000
Seventy per cent. sick in one year .....	84,000
Whole number sick in two and a half years.....	210,000
Number died—1 in 119—is.....	1,760

“This calculation is based on the state of the hospitals in time of peace. No doubt the deaths from sickness in war are much greater. Suppose we treble this result, and we have only 5,280 deaths of Ohio soldiers from disease. It does not seem that it could much exceed that. The number *killed and wounded* in the battles of the war are at least 120,000 for the whole country, of which one half at least (being the larger part of the wounded) recovered without being disabled. Ohio had about an eighth part of the whole number of soldiers. She lost, then, an eighth part of 60,000; viz, 7,500. But the sources of loss—the sick and the killed and died from wounds—give a total loss of 12,780 able-bodied men. It does not exceed this, I feel certain.”

I have assumed that in this year (at this time, January, 1865,) we have but 100,000 altogether; because the old three years regiments have mostly been discharged, and the new men to supply their places have not all been raised. On the data above given, the losses during the year 1864 are estimated as follows :

Whole number of men.....	100,000
Sick in time of peace—70 per cent.....	70,000
Died—1 in 119.....	580
Treble for time of war.....	1,740
Killed and died of wounds for whole army (the campaign being a bloody one).....	30,000
One eighth for Ohio.....	3,750
Total losses of Ohio soldiers in 1864 .....	5,690
Added, the total number above estimated to the close of 1863—killed, died of wounds and of sickness .....	12,780

---

Total loss of Ohio soldiers during the war..... 18,270

The estimate of 12,780 was made, it will be observed, for the close of 1863. In May following, the assessors ascertained, as far as possible, the

number *died in the service*, and found it to be 16,516. The three results thus given are:

My estimate for December, 1863.....	12,780
Assessors' returns in May, 1864 .....	16,516
My estimate for January, 1865.....	18,270

It will be seen from this, that if the assessors' returns are reliable (and they are probably quite near the truth), my estimates were almost exactly right. It will be seen from this case (in which the data are not as exact as in many others) that *the premises* (statistical facts) being given in any case of social movement, even the uncertain one of war, the results can be determined with prophetic accuracy.

We may conclude, then, that the total losses of Ohio, by the deaths of soldiers, since the war began, is under *twenty thousand*; and it will not reach even this number, except by allowing something for possible deficiencies in the returns of assessors.

### SECTION 3.—ABLE-BODIED MEN.

In the report of 1863, I ascertained from the laws of proportion, established by repeated censuses, the number of able-bodied men in Ohio. The statement is as follows, viz:

Of all the males in the State we have, therefore, 46 per cent. between 18 and 60, the able-bodied age. Applying this ratio to the several censuses of Ohio, we have this result:

	Whole No. of white males.	Able-bodied.
In 1810.....	119,657	55,032
1820.....	306,607	141,037
1830.....	479,713	220,668
1840.....	775,360	357,658
1850.....	1,004,117	461,892
1860.....	1,171,720	538,990
1863.....	1,227,951	554,857

In July, 1863, we had (554,857) *five hundred and fifty-four thousand eight hundred and fifty-seven able-bodied men*, belonging to the State of Ohio, between the ages of 18 and 60, from which *must be deducted those lost or disabled in war*.

If, as I have assumed above, the population of Ohio in 1864 (as appears from the number of votes and the known immigration), has increased quite as fast as in previous years, then the whole number of white males in July, 1864, was 1,244,950; 46 per cent. of these were men between 18 and 60, which gives 573,677. Now, if we deduct 20,000 from this number (the largest estimate of those died "in service"), we have 553,677 men of the arms-bearing age. Ohio can, therefore, keep 200,000 men in the field, and still carry on all the regular operations of industry successfully. No doubt there would be, for a short time, great inconvenience felt for want of labor in some departments; but society would soon adapt itself, by the aid of machinery, to all the demands of industry.

## SECTION 4.—NUMBER OF MEN IN THE ARMY.

The return made to the Governor, by Adjutant-General Cowen (*vide* Adjutant-General's report); gives the following statement of all the troops furnished by the State of Ohio since the commencement of the war:

*Recapitulation of Troops furnished by the State of Ohio for U. S. Service.*

22 Regiments 3-months Infantry, in April, 1861.....	22,000
5   "       3   "       "       in June, 1862.....	4,513
<hr/>	
Total 3-months Infantry .....	26,513
2 Companies of 3-months Artillery, in 1861 .....	200
2   "       3   "       Cavalry,   "       .....	180
<hr/>	
Total 3-months troops of all arms, 1861 and 1862.....	26,893
2 Regiments 6-months Infantry, in 1863.....	1,894
2 Battalions 6-months Cavalry, in 1863 .....	874
<hr/>	
Total 6-months troops in 1863.....	2,768
Drafted 9-months men, assigned to and mustered in old Regiments in 1862 .....	1,796
9-months drafted men in 1862, assigned to and mustered in old Regiments in 1863 .....	117
<hr/>	
Total 9-months drafted men assigned and mustered .....	1,913
Recruits for 3-years Regiments, sent to the field up to May, 1862, as per estimate of report for 1862 .....	6,500
Recruits for organizations in the field, in last eight months of 1862, as per report of that year .....	24,383
Original strength of 3-years troops, in new organizations of 1861, 1862, and 1863, 121 Regiments of Infantry....	111,666
Dennison Guards, and Trumbull Guards, Infantry.....	194
<hr/>	
	111,860
Less men transferred from 117th O. V. I., to 1st O. V. II. A. 500	
<hr/>	
Total 3-years Infantry at organization.....	111,360
8 Companies of Sharp Shooters, for 3 years.....	732
12 Regiments 3-years Cavalry.....	11,804
Independent Companies and Squadron of 3-years Cavalry .....	652
<hr/>	
Total 3-years Cavalry at organization.....	12,456
1st Regiment 3-years Light Artillery.....	1,800
26 Independent Batteries Light Artillery .....	3,907
<hr/>	
Total 3-years Light Artillery at organization .....	5,707
2 Regiments 3-years Heavy Artillery .....	3,593
Recruits for old Regiments in 1863.....	4,147
<hr/>	
Total, Jan. 1st, 1864.....	200,452
National Guards in one hundred days' service.....	35,982
Enlistments in U. S. Navy prior to Feb. 24, 1864 .....	2,367
Eleven new Regiments, under call of July 18, 1864.....	11,506
New Companies, under authority of Feb. 4.....	1,500

Raised by draft during the year.....	16,717	
13th Cavalry.....	830	
27th U. S. Colored Regiment.....	1,046	
Veterans.....	20,616	
Recruits for old organizations of all arms, including enlistments in the Navy.....	52,326	
	<hr/>	142,890
		<hr/>
Excess over all calls during the year, up to Dec. 1 .....		343,342
		<hr/>
Grand Total.....		346,326
		<hr/> <hr/>

How many of this immense body of men are now in service, is a problem very difficult to determine. But we have some data by which it can be approximated.

Looking to the above dates and terms of enlistments the following number of men must have gone out of service, viz.:

All of the 3 months' men of 1861 and 1862 .....	26,893
All the 6 months' men of 1863.....	2,768
All the 9 months' men of 1862 and 1863.....	1,913
Three years' men under the call of April, 1861 .....	82,845
Other organizations during 1861, about.....	10,000
All National Guards in one hundred days' service.....	35,982
Loss during the war .....	18,000
Disabled, per assessors reports .....	8,000
	<hr/>
Total.....	186,401

It is certain that these men are not in the service, except those who have re-enlisted since:

Whole number furnished by the State, according to the Adjutant General's Report .....	346,326
Deduct the number above .....	186,401
	<hr/>
Remaining.....	159,925

But from this must be deducted a large number, probably 15,000 or 20,000, who have been discharged from various causes, or deserted. It is safe to say that there are now not more, at farthest, than 140,000, and, *probably*, not near so many. Of these those enlisted in the naval service, colored troops, etc., make up several thousand.

#### SECTION 4—STATISTICS OF HOSPITALS.

For the last three years I have procured such statistics of hospitals in Ohio as I could, to illustrate the character of diseases and the measure of mortality among the sick and wounded of the army. This year I have but three reports, from the principal hospitals. Of these, the following is a summary, viz.:

Table 16 gives the return of the United States Marine Hospital, at Cincinnati, viz.:

Whole number of patients remaining over, or received, for the year ending December 31st, 1864.....	684
Whole number discharged, furloughed and sent to other hospitals .....	545
Deserted .....	9
Died .....	20
Remaining .....	110

From this return it appears that the number of deaths to the number of sick and wounded, in this hospital, is 1 in 34.

Table 14 exhibits the return of the sick, wounded and dead, at Washington Park Hospital, Cincinnati, for the year ending December 31st, 1864:

Whole number of sick and injured.....	228
Whole number of wounded .....	166
Died of sick and injured.....	14
Died of wounded .....	1

Of those who died, 4 were from inflammation of the lungs; 2 from measles; 3 from typhoid fever; and 2 from chronic diarrhœa. These, with rheumatism, are the most prevalent diseases; typhoid fever and inflammation of the lungs being far the most fatal. The mortality of those in the hospital, was 1 in 26.

Table 15 exhibits the return of sick, wounded and dead of Camp Dennison General Hospital. This is one of the largest hospitals in the country, and its statistics are very interesting:

The whole number of cases treated in this hospital were..	10,794
Of these there were sick .....	4,707
“ “ wounded .....	6,087
“ “ died .....	121
“ “ discharged .....	957
“ “ returned to duty, or transferred to other hospitals .....	8,160
“ “ remaining.....	1,669

It seems, from this, that the deaths were but a little more than 1 in 100. The explanation of this is that in neither of these hospitals are the worst cases of the sick and wounded. The badly sick and wounded are at “the front,” and most of them can not be removed easily. The ratio of deaths to the sick is, in time of peace, 1 in 119—we see that the deaths in Camp Dennison are but a little greater. The largest proportion of deaths occur, as in other hospitals, from pneumonia, typhoid fever and chronic diarrhœa. The summary of the above reports give:

Total number of cases treated .....	11,872
Total number of deaths .....	156
Ratio of deaths.....	1 in 80

I take the following paragraph from my report of last year, in order that it may be connected with this:

In my last report I was enabled, by the kindness of friends, to present a summary of the results of one year in the four Cincinnati hospitals. Now I shall give two of those hospitals, and the general hospital at Camp Dennison. By comparing these we obtain some interesting conclusions. The following is a general table for the year, viz.:

	U. S. Marine.	Washington Park.	Camp Dennison.
Total number received.....	1,036	969	7,770
“ wounded .....	145	408	1,409
“ sick .....	891	561	6,361
“ wounded died.....		15	1
“ sick “ .....		29	103
Proportion of wounded died.....		4 per cent.	1 in 1,407
“ of sick “ .....		5 per cent.	1.7 per cent.
Whole number of deaths.....		44	104
Proportion to whole number sick and wounded .....		5 per cent.	1½ per cent.

Connecting the above tables together, we have this general result, viz.:

Total number of cases treated .....	21,647
Total number of deaths .....	304
Ratio of deaths to cases .....	1 in 70

This is under the truth, however, since the deaths in the Marine Hospital, for last year, were not returned. They amounted to about 40, and the true ratio of deaths to cases was 1 in 63. Camp Dennison has proved a decidedly healthy situation, both to the well and to those brought there sick.

## ARTICLE VII.—SOCIAL STATISTICS.

The elements of society are, in a great degree, measurable; and all statesmanship, to be valuable, must be founded on them. Society moves on or recedes numerically, by the ratios of life and death, which are ascertained by the statistics of births, marriages and deaths. So the prosperity of society depends on the development of its energy and resources in profitable directions; and this again can only be ascertained by the statistics of industry, of structures, of manufactures, etc. So the happiness of the people must depend largely on their moral development in one or the other direction; but this must be ascertained by the statistics of education, religion, crime, litigation, debt, etc. In my reports heretofore I have treated fully the subjects of education, religion and debt, so far as they came within the measurements of statistics. In this report, and in all preceding reports, I have considered fully the agricultural and mining industry, and

incidentally the statistics of railroads, navigation, commerce, etc. Under the present head—"Social Statistics"—I have embodied all facts in regard to the social and moral elements of society which the imperfect machinery of our county statistics will afford. It is imperfect, but, nevertheless, has enabled me to give one class of facts which I believe are not obtained in any other country. Such, for example, as new structures, naturalization, etc. Naturalizations are unknown, I believe, in any other country, and I have not found the statistics of new buildings in any other country. A very little change in our laws would enable us to get a complete view of our social progress.

#### SECTION 1.—NEW STRUCTURES.

Table 11 shows the number and value of new structures to be as follows:

Number of new structures .....	6,692
Total value.....	\$4,132,836

Of the new structures, a portion were—

Factories, of different kinds.....	99
Mills .....	85
Distilleries .....	3
Rolling mills.....	2
Oil mill.....	1

No accurate account of churches and public buildings is given, but very few were built.

The comparative number and value of new structures in the last seven years are as follows:

	No.	Value.
In 1858.....	10,458	\$3,012,054
1859.....	7,812	4,972,645
1860.....	8,100	3,685,513
1861.....	9,831	4,463,042
1862.....	8,013	2,989,520
1863.....	6,278	3,009,921
1864.....	6,692	4,132,836

There is a small increase in the number of buildings erected, and an increase of 33 per cent. in value. This proves that, what general observation shows, that there is a considerable revival in the growth and enterprize of this State. The largest number of new structures are in either the new counties or those which have large towns in them. These are the counties of Hamilton, Montgomery, Cuyahoga, Lucas, Franklin, Allen, Butler, Sandusky, Greene, Crawford, Hancock, Seneca and Williams. The counties of Wayne, Stark, and some others in north-centre of the State have also increased largely in new buildings.

To show the general progress of buildings in this State since the war began, I make the following table of the *aggregate* of "new structures" in

the above fifteen counties for the years 1861-'62-'63-'64, being the four years of the war, viz:

Hamilton.....	2,166
Montgomery.....	1,151
Cuyahoga.....	1,552
Lucas.....	840
Franklin.....	943
Allen.....	550
Butler.....	628
Sandusky.....	578
Greene.....	507
Crawford.....	647
Hancock.....	616
Seneca.....	576
Williams.....	476
Wayne.....	517
Stark.....	598

It will be seen that the four counties of the north-west—Allen, Crawford, Hancock and Sandusky—have grown (as measured by the *number* of new buildings) more than the city of Cincinnati and the county of Hamilton, but the *value* of buildings in Hamilton county (erected in these four years) is, of course, more than double the value in those counties. This table shows conclusively that the war has not yet arrested the growth of this State in population and buildings.

## SECTION 2.—MARRIAGES.

Table 12 exhibits the number of marriages contracted in the State of Ohio from the 1st of July, 1863, to the 1st of July, 1864. This is a very curious subject. The number of marriages in any community depends on two general facts: 1st, The number of persons coming each year within the marriageable age; and 2d, The greater or less measures of subsistence—that is, the greater or less degree of physical prosperity among the people. Hence, if war or pestilence prevail to any great extent, the number of marriages will be diminished. Hence, also, if the subsistence of a people be so far reduced that it becomes difficult to support a family, marriages will also be reduced. Think what we will of the theory of Malthus on population (that population is limited by the means of subsistence), it is undoubtedly true that in a country where the production of food does not much exceed the demand, any great diminution of food will reduce the number of marriages. In our country no such case ever occurs. We are a grain producing country, with abundant harvests and abundant labor, so that no seasons have occurred in which food was not abundant. But we have, for the first time, a war which carried to the field so many young men that it has seriously reduced marriages in the two years past. A large number of the young men having returned, the number of marriages in 1864 has been slightly increased.

The number of marriages in Ohio during the last six years, were as follows, viz :

In 1859.....	22,671
In 1860.....	23,106
In 1861.....	22,251
In 1862.....	19,540
In 1863.....	19,300
In 1864.....	20,881

The number was greater in 1864 than in either of the two previous years, but has not yet reached the average prior to the war. The aggregate number of marriages prior to 1862 was 68,038, or an average of 22,676. The aggregate number of marriages since was 61,091, or an average of 20,363. Thus we see that the war has reduced the annual average 2,313, and the whole number in three years, *seven thousand* below what in all human probability they would have been if peace had continued. This corresponds also almost exactly with the losses of able-bodied men (page 43), which I have ascertained to have been occasioned by the war. The assessors in May made the losses of men to have been 16,000. Considerably more than half of these (say 10,000) were unmarried men, and of these three-fourths would have married. The result will come very nearly to the actual diminution of marriages. *Absence* also diminished marriages, but against this we may set off immigration and natural increase. If there had been no war; we should probably have had 24,000 marriages. In 1861 we had 23,100. We have no returns of births and deaths, but it is very evident that if there had been seven thousand more marriages in the last three years than there have been, there would have been a greater number of births in proportion; and thus in regard to population, war is producing a destructive effect, but such is the material prosperity of our country, and especially of the States in the valley of Ohio, that immigration and natural increase keep the population increasing, in spite of any losses by war.

### SECTION 3.—NATURALIZATION.

In connection with new structures and marriages, the number of annual naturalizations is interesting, as showing the degree of immigration, its increase or decrease. But few persons are naturalized—only those under (21) twenty-one—who are resident in the country less than five years. An exception to this is in the year of or preceding the Presidential election, when the excitement is so great that many who have been in the country much longer than is necessary to naturalization, and have only filed their *intentions*, are induced to take out their final papers.

Table 13 presents the number and country of those who were naturalized

from July 1, 1863 to July 1, 1864. The number and countries were as follows, viz :

Total number .....	4,983
From England, Scotland, and Wales.....	742
From Ireland .....	990
From other countries .....	457
From Germany .....	2,334
Undistinguished .....	460

It will be seen that the German nationality still greatly preponderates, making about one-half the whole number. They are distributed among all the provinces of Germany. Prussia, Baden, Bavaria, and Wurtemberg furnish the most of late years. Some Austrians have migrated to Ohio, and many Swiss. A large number of Welsh and English are now immigrating to this State who are brought over as miners, and go into the countries producing coal and iron. The largest number of these (except those in Cincinnati and Cleveland) are in Meigs, Mahoning, Trumbull, Columbiana, &c. Few French and scarcely any Italians emigrate to this State. The Irish come in about the same proportion, but not so largely to Ohio as to the Atlantic States.

The number of Naturalizations in the past seven years were, as follows, viz :

In 1858.....	4,601
1859.....	8,993
1860.....	10,479
1861.....	11,233
1862.....	2,364
1863.....	2,822
1864.....	4,983
Total number in seven years.....	45,475

These represent a population of 270,000 persons ; but how many of them may in seven years have died, or gone from the State, it is impossible now to say. The nationalities of these naturalized are as follows, viz :

England, Scotland and Wales.....	5,376
Ireland.....	8,244
Germany.....	23,957
Other countries.....	6,850

The latter class includes Swiss, French, Italians, Swedes, Norwegians.

#### SECTION 4.—CRIMES AND INDICTMENTS.

Table 17 gives a complete view of the Indictments and Convictions for crimes and their character, distinguishing between crimes against the person, against property, and those which are statutory offenses, of which the greater part are those which are caused, directly or indirectly, by selling liquor.

The following are the aggregates, viz :

Number of indictments.....	2,859
Crimes against the person.....	868
"    property.....	656
"    statutes.....	1,335
Convictions.....	1,157

The following table presents a statement of the Indictments, Crimes and Convictions, during the last eight years, viz :

	No. of indictments.	Against person.	Against property	Against statutes.	Convictions.
In 1857.....	3,236	587	938	1,696	697
1858.....	3,533	807	987	1,759	1,272
1859.....	3,493	657	966	1,615	1,585
1860.....	3,362	730	737	1,883	1,657
1861.....	2,827	724	597	1,422	1,321
1862.....	2,407	606	671	1,050	1,124
1863.....	2,443	780	704	956	914
1864.....	2,859	868	656	1,335	1,157
Average of eight years.	3,014	720	701	1,464	1,216

In the table of 1864 the county of Darke is missing, but it would have made a very slight difference in the aggregate. It will be seen from this statement that the number of crimes against property and against the statutes have diminished, but that the *crimes against the person have increased*. This is the result we might expect if all the circumstances of a domestic war are considered. Money is abundant, and the temptations to rob property are less; but war encourages violence, and men go about with arms in their hands; and in addition to this may be added the controversies which arise.

#### SECTION 5.—SUITS AND JUDGMENTS.

Table 18 gives an exhibit of the number of Suits and Judgments in the courts of this State for the year ending July 1, 1864. The numbers are as follows :

Total number of suits.....	12,560
Total number of judgments.....	8,894

The following table presents this class of statistics for seven years, the last being for 1863 :

	Suits.	Judgments.
In 1857.....	29,720	17,500
1858.....	.....	18,980
1859.....	.....	17,054
1860.....	25,147	19,938
1861.....	22,604	19,222
1862.....	21,183	18,187
1863.....	13,346	10,912

Since 1860 both suits and judgments have diminished nearly one half; and the declension since July, 1861, amounts to 40 per cent. in suits at law, and in judgments to 45 per cent. No doubt the great commercial convulsion of 1857-8, increased the suits very largely at that time; but the largest part of the decrease we now see is due to the process constantly going on, of getting out of debt.

It will be seen above, that the suits and judgments of 1864 are less than those of 1863, and less than one half those of 1860. This, at least, may be deemed a very beneficial effect of the war.

#### SECTION 6.—DEEDS AND MORTGAGES.

Table 19 gives the recorded Deeds, Leases and Mortgages, for the year ending July 1, 1864, but is very defective in consequence of the neglect of many Recorders to send me their reports in time. The table includes 67 counties, and will serve to give a correct idea of the general movement in this class of business.

#### SECTION 7.—VIOLENT DEATHS.

Connected with crimes is the subject of violent deaths; and indeed, a large number of deaths by violence are crimes; and all the residue, as well as all casualties, are caused by intemperance or gross neglect. Table 20 in the Appendix is very instructive on this subject.

The aggregate results are as follows:

Homicides .....	97
Suicides .....	65
Casualties .....	333
Inquests .....	659

The following extract from the report of last year gives a summary of violent deaths for several years:

	Homicides.	Suicides.	Casualties.
In 1858.....	65	70	310
" 1859.....	48	87	309
" 1860.....	77	85	359
" 1861.....	72	118	496
" 1862.....	57	95	441
" 1863.....	102	62	435
Total of 6 years.....	421	517	2350
Average .....	70	86	391

Although the homicides in 1863, and the suicides in 1861, were larger than usual, yet there is a remarkable similarity in the proportions throughout.

The <i>suicides</i> were, in 1860 .....	18 per cent.
“ “ “ in 1861 .....	17 “
“ “ “ in 1862 .....	17 “
“ “ “ in 1863 .....	11 “

With the exception of this year (in which the homicides were increased and suicides diminished), the *ratio* of suicides was very nearly the same. It is not improbable that, of the despairing class in which suicide arises, many may have gone into the army, as a last resort, and thus diminished the aggregate of suicides.

The total number of violent deaths this year, is 495, and the proportion of suicides is 14 per cent., maintaining very nearly the same ratio.

#### SECTION 8.—PAUPERISM.

The great bulk of pauperism in Ohio exists in the large towns, especially Cincinnati and Cleveland. I have made no attempt this year to procure accurate statistics of these ; but table 21 will give the returns of such County Infirmaries as the Auditors have reported. The returns of 70 counties give 3,775 paupers in the County Infirmaries. These counties give 279 more inmates of the infirmaries than they did last year. The same ratio for the remaining 18 counties will bring the total up to 4,700 paupers in the regular County Infirmaries. As this does not include the poor of all kinds, provided for by the cities of Cincinnati, Cleveland, Dayton and other towns, this fact alone furnishes a very inadequate idea of the aggregate pauperism of the State. The poor, supported more or less by public funds in these towns, numbered over 15,000. The aggregate number of paupers in Ohio may, therefore, be set down as varying very little from 20,000. This is 1 in 125 of the population. The war has slightly increased pauperism, but not to any great extent ; and this is due almost entirely to the ample provision made by the State, counties, towns and associations, for the support of soldiers' families—a memorable testimony to the humanity and civilization of our country.

TABLE 1.—*Meteorology of Cincinnati.* By G. W. HARPER.

## OBSERVATIONS.

The average temperature of January 1st was ten degrees below zero, the coldest day at this place on record. There were two remarkable periods of weather in January: the first nine days the average temperature was less than seven degrees, while the last nine days of the month it was over forty-nine degrees, thus combining one of the coldest and one of the warmest periods ever known in January.

February was the driest I have ever recorded.

April 8th there was a severe hail storm.

May 11th occurred a snow storm of unusual severity for so late in the spring.

September was very wet, the whole amount of rain being nearly nine inches, or about one-fourth the amount of the entire year. Nearly seven inches fell in four successive days, probably the greatest amount that ever fell at this point in so short a time.

October 14th, first frost.

GEO. W. HARPER, A.M.,  
*Cincinnati Woodward High School.*

## REMARKS.

Nov. 1st, 1864.—One large meteor. Course S. W. to N. W.

8th.—First snow.

2d to 18th.—Fifty shooting stars.

Dec. 17th.—Thunder and lightning; violent winds, 2:15 A. M.

31st.—A dark, drizzling day; quite warm until 9 P. M. Thermometer marked 53°; raining; wind S. E. at 9:30 P. M.; changed to S. W., blowing violently; snow with rain. Thermometer, at 10:30 P. M., 20°.

Jan. 1st, 1864.—7 A. M., 8°; 2 P. M., 2°; 9 P. M., 1°. Heavy wind all day. Fog rising from the water in the river. Ice formed in the Ohio Canal 6 inches in thickness. Potatoes froze in most all the cellars here.

11th.—Ohio River closed by ice, 7:10 A. M.; broke away again, 3 P. M.

12th.—Ohio River closed by ice, 12:30 P. M.; people crossing.

21st.—Gorge broke away, 5:30 A. M., doing some damage to boats laying at the wharf.

28th.—Some lilac buds out.

30th.—Lightning—south.

Feb. 16th.—Wind N. W.; 17th, 18th 19th, cold.

The following observations were made on the 17th: 7:30 A. M., 5°; 8 A. M., 4°; 8:30 A. M., 3°—change of 3 degrees in 1½ hours. Wind cold and piercing. Ice formed along shore of river.

18th.—River full of large floating cakes, reaching from shore to shore, and stopping navigation.

21st.—S. B. Ingomar plowed her way here through the ice.

23d.—Ice almost gone.

28th.—Wild geese flying south.

March 1st.—Heavy snow to-day and very wet.

April 9th.—First croaking of frogs.

14th.—First blossoming peach trees.

24th.—Violent storm, 3 P. M.

May 4th.—Slight frost last night.

10th.—Sudden atmospherical changes. Turned cold this P. M., after rains.

11th.—Wind N. W.

13th.—Thermometer to-day, 2 P. M. to 9 P. M., change 20 degrees colder.

14th.—Still cold this A. M.

18th.—River now covers a great deal of corn already planted.

25th.—Farmers replanting; water down.

June 6th.—Heavy storm, 12 M.

11th, 12th, 13th.—Frost, doing slight damage.

23d.—Heavy storm, 4:30 P. M.

27th.—Sudden change of temperature this 9 P. M.; 19 degrees in 7 hours.

27th, 28th.—Whirlwinds.

July 19th.—Fine Aurora.

22d.—Turned suddenly cold during last night.

27th.—Meteor, 9 P. M., bright and large; color whitish; course N. W. S. E.

Aug. 9th.—River at its lowest.

17th.—Heavy rain, 9 P. M. Observed 16 shooting stars during month.

Sept. 24th.—Storm, 12 M.

27th, 29th.—Heavy rains.

TABLE 3.—*Meteorology of Kelley's Island. By GEORGE C. HUNTINGTON.*

Abstract from Meteorological Journal for the year ending Dec. 31st, 1864, kept at Kelley's Island, O., by Geo. C. Huntington. Latitude, 41 deg. 35 min. 44 sec. North; Longitude, 82 deg. 42 min. 32 sec. West. Height above tide-water, 587 feet—above the level of Lake Erie, 22 feet.

## SUMMARY FOR THE YEAR ENDING DEC. 31, 1864.

Mean temperature at 7 A. M.....	47.18	deg.
“ “ “ 2 P. M.....	54.42	“
“ “ “ 9 “ .....	48.48	“
“ “ of the year from 1095 observations.....	50.03	“
Highest “ recorded at regular hour.....	92.00	“
Lowest “ “ “ “ .....	-11.00	“
Extreme range for the year .....	103.00	“
Warmest day, August 12th, mean temperance.....	85	“
Coldest day January 1st, “ .....	-5.67	“

It will be understood that a dash (—) before a figure means that it is below zero.

Latest frost in Spring, March 30.

Earliest frost in Autumn, Oct. 21, very light hoar frost.

First frost to injure vegetation, Nov. 5.

Barometer maximum, Dec. 9.....	29.97	inches.
“ minimum, March 11.....	28.63	“
“ range for the year .....	1.34	“
“ mean of the year.....	29.279	“
Amount of snow in inches, 26½.		
“ water from rain and melted snow.....	37.41	“

In my last annual communication I took occasion to call attention to the striking uniformity in the mean annual temperature of any given place, as ascertained by careful observations continued through a number of years, and observed that this mean being once known, it would be possible to predict, with a good degree of certainty, what the mean temperature of any unexpired portion of any one year would probably be, and to illustrate the principle, made an estimate of what would probably be the mean temperature of the month of December 1863. Also, an estimate of the probable mean temperature of the winter of 1863-4, comprising the months of December, January, February and March. I include March as belonging to the winter season, since it is oftentimes colder than December and is fully as winterish. This estimated temperature was widely at variance with what seemed to be the generally received opinion, to wit: that the winter of 1863-4, would be one of unusual severity. This popular belief was based on the alleged fact that certain wild animals, whose instincts were said to be unerring in such matters, had made provisions for an unusually severe winter, both in constructing and storing their habitations.

What was then conjecture has now become history, and it may not be out of place to compare the results of predictions based on the instincts of the aforesaid animals with those based on deductions from observed facts:

Our estimate for December 1863 was.....	31.71	deg.
By observation it was found to be.....	30.91	“
or seven-eighths of one degree warmer than estimated.		

Again our estimate for the four months:

December, January, February, and March was.....	31.71	deg.
By observation it was found to be.....	30.91	“
or eighth-tenths of one degree below the estimate.		

This would certainly seem to be better than blind guessing. For instead of a very cold winter, as predicted by the aforesaid animals it was almost

exactly the mean of the corresponding months for the five preceding years.

On the same principle we will now venture a prediction that the mean temperature of the three months of January, February, and March, 1865, will be considerably below that of the corresponding months for the last five years.

We use the same basis as before:

Say aggregate of monthly means for the year.....	595.56 deg.
Aggregate of monthly means by observation from April 1,	
1864, to Dec. 31, 1864, 9 months.....	511.16 “
	3)84.40 “
Leaving the aggregate mean for the three months.....	28.13 “

or a monthly mean of 28.13 degrees, or more than two and three-fourths degrees below the mean of the corresponding months for the last five years. This may be a hazardous prediction but if it comes within one degree of the truth it will tend still farther to establish the correctness of our theory.

We are not among those who believe there is any sacrilege in the attempt to pry into any of Nature's secrets; on the other hand we are firmly persuaded that Nature, in all her operations, is governed by fixed laws, and that it is not only our privilege but our duty to make ourselves acquainted with these laws as far as practicable, and to govern ourselves accordingly.

The westerly gales nearly which, every season, cause the loss of so many human lives, and so much property on our northern lakes, are all indicated by the barometer long enough in advance to allow every master of vessel who has a barometer on board, and who heeds its indications to get his vessel safely into port before the storm reaches him. At least, this is the case nine times out of ten, when a vessel is within ten or twelve hours sail of a harbor.

These facts are now so well understood that it is getting to be a common practice in England to display signals from prominent points along the coast when the barometer indicates an approaching storm. Apprising the manner of its proximity and warning him to prepare for it in season.

It is not the mariner alone who would be benefitted by striving to learn something of the laws of storms. If every farmer would provide himself with a good barometer, thermometer and pycrometer, and study their indications carefully, he would soon be able to guard in a great measure against the losses consequent on rain storm, during his baying and harvesting. One year's saving in this respect would oftentimes repay him the entire cost of instruments besides the very great degree of satisfaction in saving his property by forestalling, as it were, the elements.

GEO. HUNTINGTON.

KELLY'S ISLAND, Jan. 2, 1865.
